Mathematical Theory of Black Holes in Higher Dimensions Petya Nedkova, Stoytcho Yazadjiev, 2024-08-16 This book portrays the mathematical theory which lies behind black hole solutions in spacetimes with an extra dimension Step by step the authors build a comprehensive picture of the main concepts and tools necessary to understand these geometries In this way the book addresses questions like How do we describe black holes in higher dimensions How can we construct such geometries explicitly as exact solutions to the field equations How many independent solutions can exist and how are they classified The book concentrates on five dimensional stationary and axisymmetric spacetimes in electro vacuum and systematically introduces the most important black geometries which can arise in these settings The authors follow the natural progress of the research area by initially describing the first results that were obtained intuitively and sparked interest in the community Then the elaborate mathematical techniques are introduced which allow to systematically construct exact black hole solutions Topics like the integrability of the theory the hidden symmetries of the field equations the available Bäcklund transformations and solution generation techniques based on the inverse scattering method are covered The last part of the book is devoted to uniqueness theorems showing how to classify the black hole spacetimes and distinguish the non equivalent ones The book is not just a mere collection of facts but a methodological description of the most important mathematical techniques and constructions in an active research area The discussion is pedagogical and all the methods are demonstrated on a variety of examples Most of the book is adapted to the level of a graduate student possessing a basic knowledge of general relativity and differential equations and can serve as a practical guide for quickly acquiring the specific concepts and calculation techniques Both authors have contributed to the research area by their original results and share their own experience and perspective

Mathematics in Medicine and the Life Sciences Frank C. Hoppensteadt,Charles S. Peskin,2013-03-09 The aim of this book is to introduce the subject of mathematical modeling in the life sciences It is intended for students of mathematics the physical sciences and engineering who are curious about biology Additionally it will be useful to students of the life sciences and medicine who are unsatisfied with mere description and who seek an understanding of biological mechanism and dynamics through the use of mathematics The book will be particularly useful to premedical students because it will introduce them not only to a collection of mathematical methods but also to an assortment of phenomena involving genetics epidemics and the physiology of the heart lung and kidney Because of its introductory character mathematical prerequisites are kept to a minimum they involve only what is usually covered in the first semester of a calculus sequence The authors have drawn on their extensive experience as modelers to select examples which are simple enough to be understood at this elementary level and yet realistic enough to capture the essence of significant biological phenomena drawn from the areas of population dynamics and physiology Because the models presented are realistic the book can serve not only as an introduction to mathematical methods but also as a mathematical introduction to the biological material itself For the student who enjoys mathematics such an introduction will be far more stimulating and satisfying than the purely descriptive approach that is traditional in the biological sciences
