

Soil Erosion Research Highlights

- Erosion directly decreases productivity by reducing soil depth and removing topsoil which contain much of the soil's organic matter.
- The loss of soil organic matter (the reservoir for plant nutrients) and topsoil (contains 80% of soil's native fertility) lowers water holding capacity, reduces infiltration, adversely affects soil tilth, and decreases soil fertility.
- Erosion makes soil more susceptible to further erosion.
- Erosion carries soil to streams, lakes, and other bodies of water, contributing to siltation and sedimentation problems. Eroded soils also contains attached nutrients and possibly pesticides, diminishing water quality and posing a risk to aquatic plants, fish, and other aquatic life.
- Erosion by wind decreases air quality and can be a health risk.
- Average annual soil erosion from an 88-acre section of a watershed landscape (77% of area) which had sustained erosion from 1963 to 1988 was estimated at 7.8 tons/acre/year. Total erosion during this period was estimated at 907 tons/acre. This is equivalent to roughly 6 inches of soil depth on each of the 88 acres of the watershed which sustained erosion (Busacca and Cook).
- Researchers concluded that relative changes in aggregate stability can be predicted from changes in organic carbon and clay contents on the field landscape.
- Specific soil properties were often associated with slope position. Organic carbon and water contents were generally lowest on summit and shoulder positions, which were the more eroded areas, and highest on the footslope and toeslope positions, which had deeper soil of the Palouse series. Aggregate stability was lowest on upper slope positions and highest on lower positions. As organic carbon content increased, aggregate stability also increased.
- Crop yields have increased on a field average basis, but the increase has come more from the areas with deeper topsoils than areas with shallow topsoil or exposed subsoils. Technological advances in farming in the Palouse Region, and perhaps nationally, has largely intensified the problem of erosion, rather than reduce it (Walker and Young)
- No-till and other conservation tillage systems can have a yield advantage over conventional tillage systems on eroded and sloping landscape positions because of increased soil water storage and reduced evaporation (Pan and Hopkins). Deficiencies in available soil phosphorus in the subsoils of eroded ridgetops and sideslopes contribute to reduced yield on those landscape positions.
- Dryland crop production is highly dependent on plant-available soil water throughout the growing season. One factor which impacts soil water storage and yield potential has been the loss of topsoil through water and tillage erosion. Soil erosion almost always reduces soil water storage potential and subsequent yields. Two different impacts are involved. One of the most frequent is a reduced rate of water infiltration into the soil. This increases the potential

Soil Erosion at Multiple Scales F. W. T. Penning de Vries, F. Agus, J. M. Kerr, 1998 Approaches to research on the causes and impacts of soil erosion have changed significantly over recent years Whereas biophysical research traditionally utilized small carefully managed erosion plots models and methods are now available to study impacts of broad scale management on the hydrology and water quality of catchments and even river basins Corresponding research tools have been developed for social and economic analysis at the household farm and community levels This book reviews the latest developments in such soil erosion studies These are considered on a matrix of scales from plot to river basin and from farm to national policy Some chapters review background issues while others consider specific methods Conclusions of working groups are presented in another chapter The book is based on papers presented at a workshop held in Indonesia in November 1997 and includes authors from Europe America Australia and Asia as well as from several of the CGIAR centers **USDA Forest Service**
