Cell Cycle Control Tim Humphrey,Gavin Brooks,2008-02-04 The fundamental question of how cells grow and divide has

perplexed biologists since the development of the cell theory in the mid 19th century when it was recognized by Virchow and others that all cells come from cells. In recent years considerable effort has been applied to the identification of the basic molecules and mechanisms that regulate the cell cycle in a number of different organisms. Such studies have led to the elucidation of the central paradigms that underpin eukaryotic cell cycle control for which Lee Hartwell, Tim Hunt and Paul Nurse were jointly awarded the Nobel Prize for Medicine and Physiology in 2001 in recognition of their seminal contributions to this field. The importance of understanding the fundamental mechanisms that modulate cell division has been reiterated by relatively recent discoveries of links between cell cycle control and DNA repair, growth, cellular metabolism, development and cell death. This new phase of integrated cell cycle research provides further challenges and opportunities to the biological and medical worlds in applying these basic concepts to understanding the etiology of cancer and other proliferative diseases.

The Role of TEM4 in Cell Cycle Progression Diogjena Prifti, 2023. The intricate process of eukaryotic cell division relies heavily on the meticulous organization and regulation of various cellular components such as the microtubules and the actin based cortex. Proper coordination between these two structures is essential during cell division as failure to do so can result in aneuploidy. The role of microtubules is central to cell division particularly during mitosis. When cells enter mitosis they undergo a rapid and dynamic remodeling process during which the interphase microtubules disassemble and give rise to shorter more dynamic microtubules emanating from centrosomes. Once Nuclear Envelope Breakdown (NEBD) occurs these microtubules extend and reach the chromosomes forming a bipolar spindle in the midzone of which captured chromosomes will align. Upon achieving proper orientation and satisfying the spindle assembly checkpoint cells enter anaphase during which the chromosomes separate. The importance of the actin cytoskeleton during the process of mitosis is widely recognized. Mitotic entry is characterized by the retraction of the cell margin followed by the rounding up of the cell and the formation of the mitotic spindle. CDK1/Cyclin B activation and subsequent translocation into the nucleus are required for this process to occur. Upon activation of the complex and its translocation to the nucleus there is a loss of cellular adhesion followed by cell rounding up culminating in mitotic entry. The geometry of cell adhesion can also impact the position of the mitotic spindle and the memory of cellular events between cell generations highlighting the significance of the actin cytoskeleton to the mitotic entry process. While changes in the dynamics of the microtubule and actin cytoskeletons at the onset of mitosis appear to occur independently recent evidence suggests that there may be crosstalk between the mitotic spindle and the actin cortex through GTPases. Matthews et al 2012. RHO family GTPases are activated by guanine nucleotide exchange factors (GEFs) in response to a plethora of extracellular stimuli regulating several cellular responses such as proliferation, differentiation and movement. Among the numerous signaling events driven by RHO family GTPases are changes in cell morphology, adhesion, motility, cell cycle progression, survival, apoptosis and cytokinesis. ARHGEF17 also called TEM4, tumor endothelial marker 4, a RHO family GEF specific for RHOA/B/C has been shown to regulate the interphase cytoskeleton. TEM4

has been shown to directly bind actin specifically dynamic newly assembled actin filaments via its N terminus independently of its RHOGEF activity In interphase cells TEM4 and RHOC are proposed to suppress myosin contractility and to control focal adhesion disassembly TEM4 has also been identified as an essential mitotic protein required for the localization of Monopolar Spindle 1 MPS1 at the kinetochore This thesis aims to understand the functions of TEM4 during the cell cycle This study highlights the lack of specificity of the most commonly used commercial antibody against TEM4 and provides evidence that TEM4 plays a crucial role in mitotic entry chromosome alignment and spindle formation The downregulation of TEM4 prevents cells from rounding up and alters cortical actin in mitotic cells leading to an increased activation of RHOA as shown by quantification of RHOA GTP at the mitotic cortex confirming its function as a regulator of cellular contractility The mitotic phenotypes observed in the absence of TEM4 are found to be partially due to low levels of Cyclin B explaining the observed mitotic delay The expression of exogenous Cyclin B restores cell cycle progression increases the mitotic index and rescues the excessively lagging chromosomes observed in the absence of TEM4 Overall despite the limited literature available on TEM4 this study sheds new light on the importance of TEM4 in the cell cycle and contributes to our understanding of this protein's role in cellular processes

The Mitotic Exit Network: Methods and Protocols Fernando Monje-Casas, Ethel Queralt, 2018-11-23 This detailed book collects the main methodologies used for the analysis of the activity localization and regulation of the components of the Mitotic Exit Network MEN pathway during mitotic exit in *Saccharomyces cerevisiae* as well as for the evaluation of the roles of these proteins in other cellular processes such as the condensation of the rDNA the functionality of the mitotic checkpoints and cytokinesis Budding yeast serves as an ideal model system for dissecting the mechanisms that regulate cell cycle progression and providing new insights into the molecular basis of cell cycle control and thus into the origin of diseases that arise as a consequence of problems during cell division Therefore although this volume concentrates on *Saccharomyces cerevisiae* as a model it also details the implications that the research about the MEN have on our understanding of the mitotic exit process in higher eukaryotes Written for the highly successful *Methods in Molecular Biology* series chapters include introductions to their respective topics lists of the necessary materials and reagents step by step readily reproducible laboratory protocols and tips on troubleshooting and avoiding known pitfalls Authoritative and practical *The Mitotic Exit Network: Methods and Protocols* will be a valuable reference for cellular and molecular biologists and biochemists as well as for all scientists interested in the study of the regulation of mitotic exit using budding yeast as a model organism

Progress in Cell Cycle Research Laurent Meijer, Silvana Guidet, Lee Vogel, 2012-12-06 Now in its second year *Progress in Cell Cycle Research* was conceived to serve as an up to date introduction to various aspects of the cell division cycle Although an annual review in any field of scientific investigation can never be as current as desired especially in the cell cycle field we hope that this volume will be helpful to students to recent graduates considering a del1iation in subject and to investigators at the fringe of the cell cycle field wishing to bridge

frontiers An instructive approach to many subjects in biology is often to make comparisons between evolutionary distant organisms If one is willing to accept that yeast represent a model primitive eukaryote then it is possible to make some interesting comparisons of cell cycle control mechanisms between mammals and our little unicellular cousins By and large unicellular organisms have no need for intracellular communication With the exception of the mating phenomenon in *S cerevisiae* and perhaps some nutritional sensing mechanisms cellular division of yeast proceeds with complete disregard for neighbourly communication Multicellular organisms on the other hand depend entirely on intracellular communication to maintain structural integrity Consequently elaborate networks have evolved to either prevent or promote appropriate cell division in multicellular organisms Yet as described in chapter two the rudimentary mechanisms for fine tuning the cell division cycle in higher eukaryotes are already apparent in yeast

Progress in Cell Cycle Research Laurent

Meijer, Armelle Jézéquel, Bernard Ducommun, 2012-12-06 The Progress in Cell Cycle Research series is dedicated to serve as a collection of reviews on various aspects of the cell division cycle with special emphasis on less studied aspects We hope this series will continue to be helpful to students graduates and researchers interested in the cell cycle area and related fields We hope that reading of these chapters will constitute a point of entry into specific aspects of this vast and fast moving field of research As PCCR4 is being printed several other books on the cell cycle have appeared ref 1 3 which should complement our series This fourth volume of PCCR starts with a review on RAS pathways and how they impinge on the cell cycle chapter 1 In chapter 2 an overview is presented on the links between cell anchorage cytoskeleton and cell cycle progression A model of the G1 control in mammalian cells is provided in chapter 3 The role of histone acetylation and cell cycle control is described in chapter 4 Then follow a few reviews dedicated to specific cell cycle regulators the 14 3 3 protein chapter 5 the cdc7 Dbf4 protein kinase chapter 6 the two products of the p16 CDKN2A locus and their link with Rb and p53 chapter 7 the Ph085 cyclin dependent kinases in yeast chapter 9 the cdc25 phosphatase chapter 10 RCC1 and ran chapter 13 The intriguing phosphorylation dependent prolyl isomerization process and its function in cell cycle regulation are reviewed in chapter 8

Progress in Cell Cycle Research Laurent Meijer, Silvana Guidet, Michel Philippe, 2012-12-06 The Progress in Cell Cycle Research series has been conceived to serve as a collection of reviews on various aspects of a fast growing biology field the cell division cycle These reviews do not pretend to cover all aspects of cell cycle regulation and mechanisms but rather focus on a few topics of particular interest in the recent literature This third volume starts with a broad overview of the diversity of ways by which viruses subdue their host cell cycle chapter 1 Of particular interest in this area is the case of HN which has recently been extensively investigated chapter 2 Although most of our understanding of cell cycle regulation derives from work performed in yeast and animal cells plant models reviewed in chapter 3 for one of the best studied example Arabidopsis are starting to contribute significantly to the cell cycle general picture In mammals the regulation of cell division of two types of tissues the intestine chapter 4 and the developing muscle chapter 5 are investigated in an interesting physiological context

Cell division is accompanied by a number of morphological changes. One of them, organelle transport, is starting to be better understood (chapter 6). The next few chapters summarise our knowledge of some essential regulators of the cell cycle. A still intriguing enzyme, casein kinase 2, is reviewed in detail in chapter 7. Some of the most studied cell cycle regulators are, certainly, the CKIs (cyclin dependent kinases inhibitors) (chapter 8).
