Operating System Concepts, 10e Abridged Print Companion Abraham Silberschatz, Peter B. Galvin, Greg Gagne, 2018-01-11 The tenth edition of Operating System Concepts has been revised to keep it fresh and up to date with contemporary examples of how operating systems function as well as enhanced interactive elements to improve learning and the student's experience with the material. It combines instruction on concepts with real world applications so that students can understand the practical usage of the content. End of chapter problems, exercises, review questions, and programming exercises help to further reinforce important concepts. New interactive self-assessment problems are provided throughout the text to help students monitor their level of understanding and progress. A Linux virtual machine including C and Java source code and development tools allows students to complete programming exercises that help them engage further with the material. The Print Companion includes all of the content found in a traditional text book organized the way you would expect it but without the problems.

Parameterized Verification of Synchronized Concurrent Programs

Zeinab Ganjei, 2021-03-19 There is currently an increasing demand for concurrent programs Checking the correctness of concurrent programs is a complex task due to the interleavings of processes Sometimes violation of the correctness properties in such systems causes human or resource losses therefore it is crucial to check the correctness of such systems Two main approaches to software analysis are testing and formal verification Testing can help discover many bugs at a low cost However it cannot prove the correctness of a program Formal verification on the other hand is the approach for proving program correctness Model checking is a formal verification technique that is suitable for concurrent programs It aims to automatically establish the correctness expressed in terms of temporal properties of a program through an exhaustive search of the behavior of the system Model checking was initially introduced for the purpose of verifying finite state concurrent programs and extending it to infinite state systems is an active research area In this thesis we focus on the formal verification of parameterized systems That is systems in which the number of executing processes is not bounded a priori We provide fully automatic and parameterized model checking techniques for establishing the correctness of safety properties for certain classes of concurrent programs We provide an open source prototype for every technique and present our experimental results on several benchmarks First we address the problem of automatically checking safety properties for bounded as well as parameterized phaser programs Phaser programs are concurrent programs that make use of the complex synchronization construct of Habanero Java phasers For the bounded case we establish the decidability of checking the violation of program assertions and the undecidability of checking deadlock freedom For the parameterized case we study different formulations of the verification problem and propose an exact procedure that is guaranteed to terminate for some reachability problems even in the presence of unbounded phases and arbitrarily many spawned processes Second we propose an approach for automatic verification of parameterized concurrent programs in which shared variables are manipulated by atomic transitions to count and synchronize the spawned processes For this purpose we introduce counting predicates that related counters that refer to the number of processes satisfying some given properties to the variables that are directly manipulated by the concurrent processes We then combine existing works on the counter predicate and constrained monotonic abstraction and build a nested counterexample based refinement scheme to establish correctness Third we introduce Lazy Constrained Monotonic Abstraction for more efficient exploration of well structured abstractions of

infinite state non monotonic systems We propose several heuristics and assess the efficiency of the proposed technique by extensive experiments using our open source prototype Lastly we propose a sound but in general incomplete procedure for automatic verification of safety properties for a class of fault tolerant distributed protocols described in the Heard Of HO for short model The HO model is a popular model for describing distributed protocols We propose a verification procedure that is guaranteed to terminate even for unbounded number of the processes that execute the distributed protocol **AUUGN**
