

[9.2] What is the approximate "equilibrium" position of the membrane?

[9.3] If you continue to run the simulator after the system has reached equilibrium, why does the membrane continue to jiggle back and forth?

★ A system is at a **stable equilibrium** when it consistently returns to its original state after being pushed slightly in any direction.

[10] If the simulator is running, click the STOP button, but do NOT reset it. You can test whether the new membrane position is at a stable equilibrium by pushing it a little in one direction and seeing if it returns to that position. Without resetting the simulator, push the membrane by dragging it a little bit to the left or right, being careful not to push it past its breaking point. Then RUN the simulation for at least 500 time steps.
