The above is a suggested schedule using combination vaccines. For alternatives, details and catch-up, refer to the most current Recommended Immunization Schedule from CDC.

1. A dose of HepB vaccine is not necessary at 4 months if doses are given at birth and 2 months, but may be included as part of combination vaccine.
2. The 4-month dose is not needed if Rotavirus is used exclusively for birth dose 1 and 2 in rotavirus vaccine series.
3. The 6-month Hib dose is not needed if Pedvaxim® is used exclusively for the 2nd and 4th months/doses.
4. A child may need 1 or 2 doses of influenza vaccine based on previous vaccination history. Refer to most current influenza vaccine recommendations.
5. ACIP recommends otherwise for Hib, use the same vaccine manufacturer's DTaP for each dose. In the interim, however, vaccination should not be delayed based on the type of DTaP previously administered.
6. CDC recommends administration of quadruple MM and Varicella vaccines for the 12-15 month dose, however Varicella is not given based on clinical discretion.

pandemic Alberto López-Reyes, Aranzazu Mediero, Gabriela Angélica Martínez-Nava, 2025-11-11 Throughout the history of humanity we have managed to observe the aggressiveness of certain viruses that have claimed the lives of millions of individuals However most of the viruses we coexist with go unnoticed by most of us This phenomenon is explained mostly by the individual's immunogenetics which is an essential part of evolution Immunogenetics has provided a deep understanding of fundamental biological processes Advances in this field have helped to understand the main histocompatibility complex functions and how this could help in medical procedures To date polygenic studies assessing the combined gene effects show the importance of implementing a systemic approach to evaluate the immune system response to infections caused by pathogens such as viruses Given the importance of the current COVID 19 pandemic it is important to generate a special topic that allows us to compile the most relevant original studies and review articles on this topic The goal of this topic is to gather scientific evidence that allows us to understand why the immune genome of each individual responds differently to SARS CoV 2 infection Additionally this topic will allow the identification of gene variants that can be considered as biomarkers for predicting the outcome of COVID 19 The scientific evidence published on this topic might contribute to the diagnostic approach and therapeutic intervention for patients at high risk of developing critical outcomes of COVID 19 Scientific evidence and research articles are required to elucidate how clinical and genetic scenarios contribute to differentiating the outcome of patients infected by SARS CoV 2 Therefore it is important to investigate the involvement of gene variants in molecular mechanisms related to 1 SARS CoV 2 infection 2 Myddosome Assembly 3 Antigen Processing 4 Antigen Presentation 5 Inflammasome Assembly 6 Cytokines 7 Immune Synapse 8 Pyroptosis *Implementation of novel oral polio vaccine type 2 (nOPV2) for circulating vaccine-derived poliovirus type 2 (cVDPV2) outbreak response*, 2020-06-10

Orenstein,2009-09-18 Recent years have seen unprecedented outbreaks of avian influenza A viruses In particular highly pathogenic H5N1 viruses have not only resulted in widespread outbreaks in domestic poultry but have been transmitted to humans resulting in numerous fatalities The rapid expansion in their geographic distribution and the possibility that these viruses could acquire

the ability to spread from person to person raises the risk that such a virus could cause a global pandemic with high morbidity and mortality. An effective influenza vaccine represents the best approach to prevent and control such an emerging pandemic. However, current influenza vaccines are directed at existing seasonal influenza viruses which have little or no antigenic relationship to the highly pathogenic H5N1 strains. Concerns about pandemic preparedness have greatly stimulated research activities to develop effective vaccines for pandemic influenza viruses and to overcome the limitations inherent in current approaches to vaccine production and distribution. These limitations include the use of embryonated chicken eggs as the substrate for vaccine production which is time consuming and could involve potential biohazards in growth of new virus strains. Other limitations include the requirement that the current inactivated influenza vaccines be administered using needles and syringes requiring trained personnel which could be a bottleneck when attempting to vaccinate large populations in mass campaigns. In addition, the current inactivated vaccines that are delivered by injection elicit limited protective immunity in the upper respiratory tract where the infection process is initiated.
