Exam 2023

How many different types of molecules are shown in Model 1? - ANSWER two: circle and triangle

Number of triangles and circles on each side of membrane? - ANSWER 14 triangles on left: 0 triangles on right

12 circles on left: 13 circles on right

Which shape is larger? - ANSWER triangle

Describe direction of movement of molecules in Model 1. - ANSWER Random-all directions

Which molecules are able to pass through the semi-permeable membrane? - ANSWER Circles can fit through the gaps due to small size and are nearly equally distributed on both sides of the membrane.

Would you expect the Model 1 system to change over time? - ANSWER No. The triangles will remain on the left side because they are too big to pass through membrane. Circles will remain evenly distributed on both sides due to size and random movement.

The Molecular Basis of Membrane Function Society of General Physiologists,1969 **Membrane Hydration** E. Anibal Disalvo,2015-10-05 This

book is about the importance of water in determining the structure stability and responsive behavior of biological membranes. Water confers to lipid membranes unique features in terms of surface and mechanical properties. The analysis of the hydration forces, plasticiser effects, controlled hydration, formation of microdomains of confined water suggests that water is an active constituent in a water-lipid system. The chapters describe water organization at the lipid membrane-water interphase, the water penetration, the long-range water structure in the presence of lipid membranes by means of X-ray and neutron scattering, general polarization, fluorescent probes, ATR-FTIR and near-infrared spectroscopies, piezo-electric methods, computer simulation and surface thermodynamics. Permeation, percolation, osmotic stress, polarization, protrusion, sorption, hydrophobicity, density fluctuations are treated in detail in self-assembled bilayers. Studies in lipid monolayers show the correlation of surface pressure with water activity and its role in peptide and enzyme interactions. The book concludes with a discussion on anhydrobiosis and the effect of water replacement in microdomains and its consequence for cell function. New definitions of lipid-water interphases consider water not only as a structural-making solvent but as a mediator in signalling, metabolic activity, modulating protein insertion and enzymatic activity, triggering oscillatory reactions and functioning of membrane-bound receptors. Since these effects occur at the molecular level, membrane hydration appears fundamental to understand the behavior of nano-systems and confined environments mimicking biological systems. These insights in structural, thermodynamical and mechanical water properties give a base for new paradigms in membrane structure and function for those interested in biophysics, physical chemistry, biology, bio- and nano-medicine, biochemistry, biotechnology and nano-sciences searching for biotechnological inputs in human health, food industry, plant growing and energy conversion.

The Membranes of Cells Philip Yeagle, 1993. Membrane Shape and Biological Function José Carlos Bozelli (Jr.), Richard M. Epand, 2024-11 For a long time the main function ascribed to biological membranes was that of being a semi permeable barrier defining and determining the boundaries between cells and organelles However this view has changed The number of reported essential functions in cell biology ascribed to biological membranes has increased markedly Indeed a variety of biological processes rely on the fine tuned interaction between the membrane and its microenvironment The functioning of biological membranes is a consequence of the chemical structure and physical properties of the component molecules and their mixtures One physical property of membranes is their shape The concept of shape is intimately associated with properties of curvature but curvature and shape are not necessarily identical While the role of membrane shape in biological processes was believed to be a passive one new findings have challenged this view Membrane shape and shape changes are active ways for the membrane to trigger biological responses Hence the coupling between membrane shape and biological function represents a modern aspect of the function of biological membranes This multidisciplinary book presents state of the art discussions on membrane shape and its relation to biological processes at the intersection of medicine physics chemistry and biology The book includes fundamentals of membrane shape generation and recognition In addition there are chapters that emphasize methods to measure aspects of membrane shape as well as giving specific examples of biological phenomenon that depend on membrane shape with a discussion of the mechanism by which shape determines biological function The book encompasses theoretical and experimental aspects with examples using model systems and cellular ones The importance of membrane shape in determining biological function is a relatively new concept that has been rapidly developing in the past several years highlighting the timely importance of this book
