The Transuranium Elements V. I. Gol danskii,2012-12-06 Nearly three years have passed since the publication of the original Russian edition in which time there have appeared various papers on recent research on the transuranium elements of which the most notable concern the production of element 105 at Dubna and Berkeley There has also been much fresh information on elements 104 kurchatovium and 103 lawrencium Our knowledge of shell effects in the fission barrier has been extended Hopes of finding relatively stable superheavy elements have stimulated searches for such elements in nature as well as rapid development in heavy ion acceleration We may see some very considerable discoveries in the next few years The new results vary in reliability and so it is not surprising that some papers on the properties of the heaviest elements have given rise to vigorous debates whose value lies in the way they advance the subject We have not attempted to give an exhaustive survey of recent papers and have merely added brief sections to reflect what we consider to be the most important points from these So far the United states and the USSR have made the most considerable contributions to the synthesis study and use of the transuranium elements so it is especially welcome to us that this book first published in our
