### **DIFFERENCES BETWEEN MITOSIS AND MEIOSIS**

| <b><u>MITOSIS:</u></b>                                                     | <b><u>MEIOSIS:</u></b>                                |
|----------------------------------------------------------------------------|-------------------------------------------------------|
| • Mitosis involves 2 cell divisions                                        | • Mitosis involves 1 cell division                    |
| • Mitosis gives rise to somatic cells                                      | • Gives rise to somatic cells                         |
| • Cells produced are haploid                                               | • Cells produced are diploid                          |
| • Differs according to gender                                              | • Has no gender specification                         |
| • 2 phases                                                                 | • One phase                                           |
| • 4 daughter cells formed                                                  | • 2 daughter cells formed                             |
| • Half the number of chromosomes to the parent cell                        | • Same number of chromosomes as parent cell           |
| • All cells formed are genetically different to each other and parent cell | • Genetically identical to each other and parent cell |
| • Cells responsible for genetic variation in reproduction                  | • Cells responsible for growth and repair             |

### **DIFFERENCES BETWEEN MEIOSIS I AND MEIOSIS II**

| <b><u>MEIOSIS 1</u></b>                                                  | <b><u>MEIOSIS 2</u></b>                                      |
|--------------------------------------------------------------------------|--------------------------------------------------------------|
| • Crossing over occurs in prophase I                                     | • No crossing over occurs                                    |
| • Chromosomes arranged at the equator in homologous pairs in metaphase I | • Chromosomes arranged singly at the equator in metaphase II |
| • Homologous chromosomes pairs separate                                  | • Sister chromatids separate                                 |
| • Whole chromosomes are pulled to opposite poles in anaphase I           | • Chromatids are pulled to opposite poles in anaphase II     |
| • 2 diploid daughter cells produced                                      | • 4 haploid daughter cells produced                          |

### **THE IMPORTANCE OF MEIOSIS**

- Production of haploid gametes
- The halving effect of meiosis overcomes the doubling effect of fertilisation, thus maintaining a constant chromosome number from one generation to the next
- Mechanism to introduce genetic variation through:
  - Crossing over
  - The random arrangement of chromosomes at the equator

### **ABNORMAL MEIOSIS**

Non-disjunction and its consequences

- Non-disjunction of chromosome pair 21 during Anaphase I in humans to form abnormal gametes with an extra copy of chromosome 21
- The fusion between an abnormal gamete (24 chromosomes) and a normal gamete (23 chromosomes) may lead to Down syndrome
