Tracking the Causes and Spread of Infectious Diseases Don Nardo,2021-08 Epidemiologists are medical experts with one of the most interesting compelling and important jobs in human society This title examines how these disease detectives use a variety of specialized tools to figure out where infectious diseases came from how they spread and how they can be contained Environmental Lifestyles and Transmission of Pathogens ,2014 Oxford Textbook of Infectious Disease Control Andrew Cliff,Matthew Smallman-Raynor,2013-04-11 The Oxford Textbook of Infectious Disease Control A Geographical Analysis from Medieval Quarantine to Global Eradication is a comprehensive analysis of spatial theory and the practical methods used to prevent the geographical spread of communicable diseases in humans Drawing on current and historical examples spanning seven centuries from across the globe this indispensable volume demonstrates how to mitigate the public health impact of infections in disease hotspots and prevent the propagation of infection from such hotspots into other geographical locations Containing case studies of longstanding global killers such as influenza measles and poliomyelitis through to newly emerged diseases like SARS and highly pathogenic avian influenza in humans this book integrates theory data and spatial analysis and locates these quantitative analyses in the context of global demographic and health policy change Beautifully illustrated with over 100 original maps and diagrams to aid understanding and assimilation in six sections the authors examine surveillance quarantine vaccination and forecasting for disease control The discussion covers theoretical approaches techniques and systems central to mitigating disease spread and methods that deliver

practical disease control Essential information is also provided on the geographical eradication of diseases including the design of early warning systems that detect the geographical spread of epidemics enabling students and practitioners to design spatially targeted control strategies Despite the early hope of eradication of many communicable diseases after the global eradication of smallpox by 1979 the world is still working at the control and elimination of the spatial spread of newly emerging and resurgent infectious diseases Learning from past examples and incorporating modern surveillance and reporting techniques that are used to design value for money spatially targeted interventions to protect public health the Oxford Textbook of Infectious Disease Control is an essential resource for all those working in or studying ways to control the spread of communicable diseases between humans in a timely and cost effective manner It is ideal for specialists and students in infectious disease control as well as those in the medical sciences epidemiology demography public health geography and medical history

Viral Warfare Richard, 2023-11-17 Infectious diseases have been a constant threat to human health throughout history These diseases are caused by pathogenic microorganisms such as viruses bacteria fungi or parasites and they can easily spread from person to person As students it is important to have a comprehensive understanding of infectious diseases in order to navigate the world around us and protect ourselves and others from potential harm This subchapter aims to provide

students with a solid foundation in understanding infectious diseases We will explore the different types of pathogens their modes of transmission and the factors that contribute to the spread of these diseases Additionally we will delve into the importance of early detection prevention strategies and the role of vaccinations in controlling and eradicating infectious diseases To begin let s explore the various types of pathogens that can cause infectious diseases Viruses such as the flu virus or the common cold virus are tiny infectious agents that can only replicate inside living cells Bacteria on the other hand are single celled organisms that can multiply rapidly and cause diseases like tuberculosis or strep throat Fungi including molds and yeasts can cause infections such as athlete s foot or thrush Lastly parasites such as malaria causing Plasmodium or intestinal worms can also lead to infectious diseases Understanding the modes of transmission is crucial in preventing the spread of infectious diseases Some diseases like the flu or COVID 19 can spread through respiratory droplets when an infected person coughs or sneezes Others like sexually transmitted infections can be transmitted through sexual contact Poor sanitation and contaminated water sources can also contribute to the spread of diseases like cholera or dysentery Prevention strategies play a vital role in reducing the risk of infectious diseases Simple measures such as hand hygiene proper disposal of waste and maintaining a clean environment can go a long way in preventing the transmission of pathogens Vaccinations are one of the most effective ways to combat infectious diseases They stimulate the immune system to recognize and fight specific pathogens providing immunity against future infections Early detection is also paramount in managing infectious diseases Recognizing the symptoms and seeking medical attention promptly can help prevent the spread of contagious diseases Many infectious diseases can be treated with antibiotics antiviral drugs or antifungal medications but early intervention is crucial for successful treatment outcomes

Evaluation of the Use of Wastewater Based Epidemiology as a Surveillance Tool and the Potential Effects of Vaccines and Students Beliefs and Practices in Mitigating the Spread of COVID-19 Among Students at East Carolina University Avian White, 2022

Worldwide newly emerging and re emerging infectious diseases and pathogens have led to increases in the number and frequency of disease outbreaks Although these disease outbreaks are not new increases in outbreaks have led to the need for public health agencies to effectively monitor disease spread It has been estimated that 25% of 60 million deaths occurring yearly are the result of infectious diseases Fauci et al 2005 Nii Trebi 2017 Thus disease monitoring tools are of utmost importance The outbreak and spread of a severe acute respiratory illness in China alerted the world to a potentially new or re emerging pathogen As the virus rapidly spread it was named Severe Acute Respiratory Syndrome 2 SARS CoV 2 by the World Health Organization WHO The SARS CoV 2 virus was deemed a public health emergency and later declared a pandemic as people across the world contracted COVID 19 The rapid spread of the COVID 19 pandemic underscored the need for disease monitoring and surveillance to mitigate spread SARS CoV 2 causes fever dry cough shortness of breath and in some instances loss of taste and smell However some persons particularly those with pre

existing conditions may experience severe symptoms of high fever severe cough pneumonia and even death WHO 2020 In the United States alone an estimated 88 044 073 cases have occurred since the start of the epidemic Worldometer 2022 Early strategies to handle the epidemic included temporary sheltering in place orders and many institutions including schools and universities shifted to online strategies to ensure continuity in learning As these entities later sought to fully re open and regain a sense of normalcy many were tasked with establishing monitoring systems to help detect potential outbreaks The use of wastewater based surveillance was evaluated as a tool in helping to identify when and where student polymerase chain reaction PCR testing should be conducted Here we utilized wastewater based epidemiology by sampling dormitory wastewater thrice weekly during Spring and Fall 2021 Data obtained from this sampling was used to help identify potential cases of COVID 19 in dormitories Additionally as vaccines were developed and distributed the relationship between vaccination rates and COVID 19 cases on campus was investigated Lastly students attitudes and behaviors toward the virus were also evaluated by administering an online survey tool designed through REDCAP systems This survey utilized a Likert scale where possible to aid in analysis and comparison of student responses between Spring 2021 and Fall 2021 semesters Results from this study found significantly higher concentrations of SARS CoV 2 in wastewater were observed during the Spring relative to the Fall semester Dorms with higher numbers of COVID 19 cases also had higher concentrations of SARS CoV 2 in their wastewater A significant inverse relationship was observed between vaccine rates and student COVID 19 cases As vaccination rates increased within the dormitories the number of student cases decreased Students became more receptive to the vaccine in the Fall semester in comparison to the Spring This change in attitudes may have helped the University s vaccination rates in the Fall semester thus affecting student COVID 19 rates Here we saw students a significant difference in virus perception between Spring 2021 and Fall 2021 semesters Specifically a lower number of students having a negative perception of the virus Additionally students reported having less restrictive behavior e g visitors mask wearing in Fall 2021 compared to Spring 2021 Overall this study showed that universities may successfully use surveillance techniques such as wastewater based epidemiology to help determine when swarm testing of students should be initiated It also provided evidence that vaccination campaigns may have helped to reduce the incidence rate of COVID 19 on campus Gaining an understanding of how students feel and behave regarding the threat of disease outbreaks the implementation of various preventative measures and the effects that changes in educational delivery platforms may have on learning and social interactions are also important for developing successful programs to mitigate the spread of diseases Infectious Diseases and Our Planet Miranda I. Teboh-Ewungkem, Gideon Akumah Ngwa, 2021 This book features recent research in mathematical modeling of indirectly and directly transmitted infectious diseases in humans animals and plants It compiles nine not previously published studies that illustrate the dynamic spread of infectious diseases offering a broad range of models to enrich understanding It demonstrates the capability of mathematical modeling to capture disease spread and interaction

dynamics as well as the complicating factors of various evolutionary processes In addition it presents applications to real world disease control by commenting on key parameters and dominant pathways related to transmission While aimed at early graduate level students the book can also provide insights to established researchers in that it presents a survey of current topics and methodologies in a constantly evolving field Patterns of spread in insect-pathogen systems Andrew White,A D (Allan) Watt,R S (Rosie) Hails,S E (Susan) Hartley,Pathogen Population Ecology,2000 The Next Plague and How Science Will Stop It Alex Berezow,Hank Campbell,Julianna LeMieux,Steve Schow,2018-05-04 One hundred and fifty years ago a scientific revolution occurred Researchers figured out that disease is not spread by bad air but by infectious microorganisms This insight changed the world Through a combination of vaccination pasteurization and water chlorination in addition to improved sanitation and hygiene infectious disease has largely become an afterthought in the developed world However pathogens aren t entirely gone Antibiotic resistant bacteria are on the rise An influenza pandemic is an ever present threat Bizarre viruses from obscure parts of the world are creeping into our cities Many public health officials fear that complacency could make us susceptible to another plague The good news is that we can stop it if we arm ourselves with science and vigilance **Population Movements, Environmental Factors, and Infectious Disease Transmission**

Alexandre Blake,2023 Infectious disease transmission is deeply tied to host mobility and the environment Transmission can occur when susceptible individuals contact either infectious hosts or environmental reservoirs For humans this contact is often the direct result of the mobility of susceptible and infected individuals or the influence of the environment on host mobility and or pathogen survival Although these fundamental principles are well known there is strong spatial heterogeneity in mobility and its drivers There has also been an exponential increase in mobility in the last 150 years Many critical features of our environment have changed rapidly during this same time as well A better understanding of the dynamic interactions between pathogens host mobility particularly human mobility and the environment is necessary to design effective infectious disease control strategy This dissertation examines these interactions by investigating how mobility and environment influence the dynamics of two diseases measles and cholera Measles is a viral disease that infects human hosts exclusively while cholera is a bacterial disease with an aquatic reservoir Measles infection or successful vaccination leads to life long immunity In contrast for cholera immunity following infection or successful vaccination is short lived These fundamental differences between the two diseases allowed me to focus on specific aspects on the interactions between transmission mobility and the environment I first explore how population mobility influences measles transmission in Niger I then consider a more complex situation with both population mobility and environmental factors potentially influencing cholera transmission and persistence in the Democratic Republic of Congo DRC first in a city and next in a larger metapopulation I also investigate the data representativeness for estimating population size and mobility in a health vulnerable population a semi nomadic population in Namibia I focus on a modern data stream mobile phone based data that is frequently used to

represent mobility in public health efforts I examine these interactions at various spatial scales using statistical and mechanistic modeling associating surveillance data and geospatial information My findings emphasize that expanding our understanding of how mobility and environmental factors influence pathogen transmission is critical to improve and adapt infectious disease control strategies Understanding these interactions is critical to directly target transmission in settings where traditional strategies have consistently produced suboptimal results

Disease Transmission in Heterogeneous Populations James Oliver Lloyd-Smith, 2005

Who Gets Infected and Why: Confronting Models with Data to Determine Drivers of Pathogen Susceptibility at the Individual and Population-level Katelyn M Gostic, 2019

Host susceptibility is a foundational concept in infectious disease dynamics Susceptible individuals are the fuel that allows outbreaks to grow and spread Once an epidemic takes hold depletion of susceptible hosts through new infections eventually drives the effective reproduction number R_{eff} below 1 causing the outbreak to stutter and fade Eventually the demographic buildup of new susceptible hosts via new births creates conditions hospitable to a new epidemic cycle Ultimately the fraction of the population susceptible to a given pathogen and heterogeneity in individual susceptibility by age by birth year or by physiological status determine whether a pathogen can spread and persist in a given host population Despite its crucial importance understanding how host susceptibility is distributed across populations is a perennial challenge Many pathogens of humans and animals have complex strain structure with partial cross protection acting among a variety of serotypes Immunity to other pathogens may wane over time or may reduce disease severity without entirely preventing infection For the myriad pathogens with these characteristics host susceptibility can be difficult to model and difficult to measure even when serological data on antibody titers is available Individual susceptibility is an emergent property of within host interactions between pathogens and immune effectors The specific immune interactions that determine susceptibility are often pathogen specific and difficult to observe However individual level data on infection outcomes or population level epidemiological data are abundant Statistical analysis of these existing data can help identify host level factors that govern individual susceptibility In turn these insights can be used to improve our understanding of how susceptibility is distributed across the population and predictions of epidemic spread These inferences can also provide clues to the underlying molecular drivers of host immunity against specific pathogens In chapter 1 I compile publicly available data on two avian influenza viruses H5N1 and H7N9 which have each spilled over to cause hundreds of human cases I perform likelihood based model comparison on these data to show that individuals gain exceptionally strong lifelong protection against avian influenza subtypes in the same phylogenetic group as the first influenza virus encountered in childhood These results show that susceptibility varies systematically with birth year and challenge the long standing assumption that antigenically novel zoonotic or pandemic influenza viruses escape pre existing immunity when they spill over to cause cases in humans These results can help explain why certain birth years have been spared during past influenza pandemics and may help improve

birth year specific forecasts of future pandemic risk Further these results suggest an antigenic basis for naturally occurring broadly protective influenza immunity In chapter 2 I analyze a large epidemiological surveillance data set to ask whether the same patterns of broadly protective childhood immune imprinting shape birth year specific risk from the seasonal influenza viruses that cause wintertime epidemics in humans Model selection shows that seasonal influenza risk from subtypes H1N1 and H3N2 is indeed tied to birth year and shaped by childhood immune imprinting However unlike for avian influenza immune cross protection acts more narrowly Individuals only gain imprinting protection against seasonal influenza viruses of the very same antigenic subtype as the first virus encountered in childhood Together results from chapters 1 and 2 provide a partial proof of concept for development of universal influenza vaccines Chapter 1 illustrates that the sort of broadly protective immune responses that universal vaccines would aim to elicit can already act naturally in human populations and in certain epidemic contexts already seem to shape population susceptibility But chapter 2 highlights the difficulty of deploying these broadly protective immune responses against familiar high burden seasonal strains Taken alongside recent immunological evidence these results suggest that the breadth of immune cross protection against influenza viruses is not fixed but instead is an emergent property of within host competition between B cell antibody producing clones On exposure to a familiar seasonal influenza virus narrowly protective B cell clones competitively exclude broadly protective clones and the antibody response provides only narrow immune cross protection against a single viral subtype But on exposure to a novel avian influenza virus the host may only recognize conserved viral epitopes and more broadly protective B cell clones are transiently released from competition In chapter 3 I shift my focus from childhood imprinting history to explore another dimension of host susceptibility the role of physical immune barriers in infection resistance I develop a mechanistic dose response model to identify factors that limit the spillover of an environmentally abundant bacterial pathogen *Leptospira interrogans* Hosts living in contaminated environments may be exposed to low doses of *Leptospira* on a daily basis yet not all become infected Using data from animal challenge experiments we show that broken skin is most likely necessary for low dose environmental exposures to cause infection Together these studies illustrate that heterogeneity in host susceptibility can be linked to measurable underlying drivers Demographic factors like year of birth and immune history predictably modulate susceptibility to specific influenza virus subtypes Physiological factors like the presence of wounds and abrasions predictably modulate susceptibility to environmentally persistent bacterial pathogens like *Leptospira* By developing models based on biological principles and then confronting those models with data we can identify specific risk factors that govern individual susceptibility against specific pathogens Scaling these insights up to the population level can improve our ability to estimate key epidemiological parameters and can help guide the distribution of limited treatment or prevention resources during outbreaks
