

How does the water cycle work?

Have you ever wondered where water comes from? Have you ever thought about where water disappears to? Water is an essential part of life. The Earth has a limited amount of water, however, it is continually recycled in a process called the water cycle. Read on to find out more about the water cycle and how water on Earth is constantly moving and changing.

Precipitation

To begin with, precipitation occurs when so much water has formed that the air cannot hold it any longer. The clouds become heavier and as a result, water falls back to the Earth in the form of rain, hail, sleet or snow.

Infiltration

When water falls back to the earth as precipitation, it may fall back in the oceans, lakes, rivers or it may end up on land. When it ends up on land, it soaks into the earth and is stored as ground water. This process is called infiltration.

Evaporation

Evaporation is when the sun heats up water in rivers, lakes or oceans and turns it into vapour or steam. The water vapour or steam leaves the river, lake or ocean and goes into the air. This stage is called evaporation.

Condensation

The water vapour cools and this leads to clouds forming. However, the clouds are unable to hold the water vapour for long. As a result, rain drops form and it starts to rain. This process is called condensation.

Continually, the water cycle begins again.

The water cycle is an ongoing process.
