

`RemoveEventHandler` will do nothing. `XtRemoveEventHandler` is also silent about failing to remove a handler that was never added or a handler that was incorrectly specified.

9.1.4 Adding Raw Event Handlers

Xt also allows you to add event handlers without actually selecting events. The main purpose of this feature is for Xt to register functions before widgets are realized (because events can't be selected until windows are created during realization). Event handlers registered without selecting events are called *raw* event handlers, and are added with `XtAddRawEventHandler` or `XtInsertRawEventHandler`, which have the same calling sequences as `XtAddEventHandler` and `XtInsertEventHandler`. The event mask indicates which events the handler will be called in response to, but only when these events are selected elsewhere. Raw event handlers are supported mostly because they are used inside Xt. They are mentioned here only for completeness—you are unlikely to need them.

A raw event handler might be used to “shadow” another event handler (both added with the same event mask), such that until a primary event handler is added, the shadow handler will never be called. The primary handler will be added with `XtAddEventHandler`, which will select events, and then both handlers will be called when the appropriate events occur.

However, the “shadowing” technique is not necessary to assure that multiple calls to `XtAddEventHandler` don't result in wasted `XSelectInput` calls in which the event mask has not changed. Xt keeps a cache of the event masks of each widget, and calls `XSelectInput` only when it is necessary to change the window's event mask attribute in the server.

Raw event handlers are removed with a call to `XtRemoveRawEventHandler`.

9.2 Writing Routines That Use Specific Event Data

An event is a packet of information that the server sends to the client. Xlib takes this packet from the network and places it into an `XEvent` structure and places it on a queue until the client program requests it. Xt requests events from this queue and dispatches the event to the appropriate action routine or event handler for the widget in which the event occurred. The event itself is passed as an argument to the routine.*

Actually, `XEvent` is a C-Language union of many event structures all the same size but with some different field names. The first member of the union, and of any of the individual event structures, is the event type. Table 9-2, later in this section, lists the event types and the matching event structure types.

*We'll look at the low-level routines Xt provides for directly manipulating the event queue later in this chapter.
