

## Starfish Dissection

### Part A. External anatomy (aboral surface)

1. Place your starfish in the dissecting tray so the dorsal (aboral) surface faces upward.
2. There is a central disk in the center of the starfish and the five arms or rays that extend from it.
3. There are many spines scattered over the surface of the arms and the central disk. These spines are attached to the plates of the starfish skeleton just under the skin. These plates are called ossicles and make up the endoskeleton of the starfish.
4. Among the spines are skin gills and small pincer-like pedicellarias. The skin gills are the respiratory structures of the starfish and the pedicellarias keep the skin gills free of debris. You can see these structures on the diagram below.

5. Locate the small, round, wart like madreporite plate on top of the central disc. Water enters through this structure into the water vascular system of the starfish.
6. The tip of each arm has a small eyespot and a single tentacle used to detect light, touch and light pressure.
7. Label the central disc, arm, madreporite plate and eyespot on figure 1.

Figure 1

### Part B. External anatomy (oral surface)

8. Turn the starfish over to its ventral (oral) surface.
9. Locate the mouth in the center of the central disc. Find the ring of oral spines surrounding the mouth. These spines filter what go into and out of the starfish.
