health and remains one of the major infectious diseases worldwide. Effective detection and treatment of both drug sensitive and drug resistant TB are key challenges in the fight against TB. Currently only about 50% of the WHO target TB cases are detected and only 30-40% of drug resistant TB cases are recognized. Treatment success rates are approximately 85% for drug sensitive TB and drop to only 60% for multi drug resistant TB (MDR TB) on average worldwide. Early detection of TB cases is the first step to providing patients with appropriate treatment. Recognizing drug resistant TB is more challenging and requires quick and accurate drug susceptibility test (DST) methods. In addition to improved diagnosis and DST, the discovery of new drug targets is crucial for TB control. This Research Topic focusses on TB and drug resistance diagnosis and drug target discovery. It aims to explore novel TB diagnosis methods to quickly find TB cases and recognize drug resistance. DST for anti TB drugs is also essential to guide the further diagnosis of drug resistant TB, how to evaluate and compare them and establish new DST methods to further guide clinics to use rationally is the other purpose under this topic. At the same time this Research Topic aims to explore new drug resistance mechanisms and tools to study drug resistance. Finally it explores new drug targets and tools to study them.

Wang, Qinghong Li, Rachel Pilla, Alessandro Gramenzi, 2025-11-13. The animal microbiome is the collection of microorganisms that inhabit various body locations including archaea, bacteria, viruses, fungi and other microbes. The microbiota primarily reside in the gut, providing essential nutrients to the host and are directly relevant to digestive health and nutrient assimilation. In addition, microbiota at other body locations including the skin, nasal cavity, oral cavity, respiratory tract and reproductive organs affect every aspect of host physiology. They play crucial roles in maintaining and modulating biological functions and the overall health of the host animal. The gut microbiome also influences brain function, mental health and behavior through the gut microbiome-brain axis, which is facilitated by neurotransmitters and metabolites secreted by the gut microbes. While there has been significant research on the human gut microbiome and its role in health and disease, the understanding of the gut microbiome in cats and dogs is still in its early stages. The goal of this special research topic is to boost companion animal microbiome research and enhance our understanding of the diversity and complexity of canine and feline microbiomes at the omics and systems biology level. With state-of-the-art next generation sequencing technologies and multi-omics analytical approaches, we aim to characterize the composition and variability of healthy canine and feline microbiomes as well as their development and maturation. In addition, we seek factors that influence the microbiome, leading to shifts in composition or dysbiosis. These factors include but are not limited to genetic factors, diet, nutrition, environmental factors and health/disease status. One of the focuses is to identify the microbiome correlates and/or causal microbiome signatures of canine and feline diseases, including common gastrointestinal issues, immune disorders, allergies, skin infections, obesity, behavior, cardiovascular and renal diseases, urinary tract infections and mental health issues. The knowledge we gain

about the microbiome in cats and dogs has great potential for practical implications in veterinary medicine to improve animal health and well being through early diagnosis the development of prebiotics probiotics to promote gut health and the prevention or treatment of companion animal diseases The special research topic will solicit primary research manuscripts and reviews on the canine and feline microbiome of the following research areas omics techniques in characterizing microbiome metagenomic metatranscriptomic metabolomic investigation of healthy microbiome development variability and maturation microbiome research at omics and or systems biology level in the context of disease animal welfare nutrition behavior mental health gastrointestinal health and immunity omics or multi omics studies to investigate host and or gut microbiome responses to interventions and manipulations through prebiotics probiotics postbiotics psychobiotics nutritional supplements pharmaceutical treatment and fecal microbiota transplantations heritability ecology and evolution of canine and feline microbiome at omics system level Studies using 16S rRNA ampliconic sequencing are welcome if they are accompanied by a clear hypothesis and experimentation and provide insight into the microbiological system or process being studied To conform to Systems Microbiology section guidelines we do not consider descriptive studies that are solely based on amplicon profiles *Bailey's index to 'The Times'*. Populations Peter Crome,Esther-Lee Marcus ,Marios Kyriazis,2025-10-28 Geriatric Medicine has emerged as a crucial field since its inception in the mid twentieth century by Marjory Warren in England This area of healthcare focuses on the unique needs of the aging population which is rapidly increasing worldwide While some countries have developed comprehensive geriatric care systems including specialized medical professionals community services and palliative care others are still grappling with the challenges of providing adequate services for their elderly citizens The disparity in geriatric care across different nations highlights the need for a global exchange of knowledge and strategies Recent studies have shown that countries with well established geriatric care systems can serve as models for those still developing their services However

there remains a significant gap in understanding how these successful frameworks can be adapted and implemented in diverse cultural and economic contexts Addressing this gap is essential for ensuring that all aging populations receive the care and support they need This research topic aims to explore and document the diverse structures and developments of geriatric care across different countries By examining the aging demographics availability of specialized healthcare professionals and existing services this research seeks to identify best practices and innovative strategies that can be shared globally The objective is to foster a collaborative environment where countries can learn from each other s experiences ultimately leading to improved geriatric care worldwide Key questions include how countries with less developed systems can enhance their geriatric care and what role international collaboration can play in this process To gather further insights into the global landscape of geriatric care we welcome Original Research Review Mini review Case Report Clinical Trial and Opinion articles addressing but not limited to the following themes The country specific aging structure of the population An overview of professional and academic healthcare providers Structure of healthcare services for the older patient Country specific challenges and future planning and developments Examples of countries with well established geriatric care systems which served as models for countries still developing their services By sharing research and insights we aim to build a comprehensive body of work that significantly advances progress in geriatric care ensuring that all elderly individuals receive the support and services they deserve *Impact of the Coronavirus Pandemic (COVID-19) on Mood Disorders and Suicide* Paul Stokes,Carlo Lai,Paola Aceto,Roger McIntyre,Richard Porter,2022-02-28 **Resources in education** ,1987
