PARTICLE THEORY AND STATES OF MATTER

What is the arrangement of particles in each state of matter? What is the change of state called? Can you give examples of substances that can do this?

Particle Theory is the theory that all matter is made up of tiny particles. These particles have different arrangements in each state of matter. The particles are constantly moving, and the way they move changes when the state of matter changes.

States of Matter are the different forms that matter can take. The three main states are solid, liquid, and gas. There are also other states, such as plasma and Bose-Einstein condensate.

Changes of State are the processes by which matter changes from one state to another. These include melting, freezing, boiling, condensing, sublimation, and deposition.

Solid In a solid, particles are packed closely together in a regular arrangement. They vibrate in fixed positions but do not move from their places. Solids have a fixed shape and volume.

Liquid In a liquid, particles are packed closely together but can move past each other. Liquids have a fixed volume but no fixed shape.

Gas In a gas, particles are far apart and move rapidly in all directions. Gases have no fixed shape or volume.

Plasma Plasma is a state of matter where particles are ionized and move freely. It has no fixed shape or volume.

Bose-Einstein Condensate This is a state of matter where particles are at very low temperatures and move very slowly. It has no fixed shape or volume.

Changes of State are the processes by which matter changes from one state to another. These include melting, freezing, boiling, condensing, sublimation, and deposition.

Melting is the process by which a solid changes to a liquid. This happens when the particles gain enough energy to overcome the forces holding them in place.

Freezing is the process by which a liquid changes to a solid. This happens when the particles lose enough energy to be held in place.

Boiling is the process by which a liquid changes to a gas. This happens when the particles gain enough energy to escape the liquid.

Condensing is the process by which a gas changes to a liquid. This happens when the particles lose enough energy to be held together.

Sublimation is the process by which a solid changes to a gas. This happens when the particles gain enough energy to escape the solid.

Deposition is the process by which a gas changes to a solid. This happens when the particles lose enough energy to be held together.

5 What does the diagram show about the particles in each state?

6 How do you know that the particles are moving in each state?
