

WATER QUALITY PARAMETERS & INDICATORS

Water quality describes the "condition" of water in various systems. Water quality tests can give information about the health of the ecosystem. By testing water over a period of time, the changes in the quality of the water can be seen.

Parameters that may be tested include temperature, pH, salinity, acidity, oxygen and phosphorus. The development of the aquatic macroinvertebrates test also provides an indication of water quality.

TEMPERATURE

Temperature of a system is important because it affects the amount of dissolved oxygen in the water. The amount of oxygen that fish breathe or some organisms need depends on the amount of water at 67°F will hold about 9.0 to 9.5 mg of oxygen per liter, while at 82°F it will hold only up to 7.0 mg.

Temperature also affects the rate of photosynthesis of plants and respiration rate of animals present. Rates of development during and between life span stages, maturity, migration patterns and the frequency of reproduction in insects are also very sensitive to temperature. Aquatic organisms are often sensitive indicators of temperature.

Temperature ranges the water can tolerate can be determined by looking at what can stand and which are intolerant ranges from them.

SALINITY

Salinity is a measure of the dissolved salts in the water. Salinity is usually highest where evaporation of water leaves more minerals in water bodies and lower where salinity is reduced by the input of new (freshwater) water. Salinity describes the amount of dissolved salts in the water, or the dissolved concentration, which is the quantity of a substance dissolved in a solvent and is expressed in various but standard ways. Some ways commonly referred to are density, mass percent water in samples that can be weighed for 100 and mass water in samples that can be weighed for 100 and mass water.

Water Quality Test Tables		
TEST TYPE	PH RANGE	TEMPERATURE
PH TEST	7.0 - 8.0	70 - 80
TEMPERATURE TEST	70 - 80	70 - 80
