2-2. If $\theta = 60^\circ$ and $T = 5 \text{ kN}$, determine the magnitude of the resultant force acting on the eyebolt and its direction measured clockwise from the positive x axis.

The parallelogram law of addition and the triangular rule are shown in Figs. *a* and *b*, respectively.

Applying the law of cosines to Fig. *b*,

$$F_R = \sqrt{5^2 + 8^2 - 2(5)(8)\cos 105^\circ} \\ = 10.47 \text{ kN} \approx 10.5 \text{ kN}$$

Ans.

Applying the law of sines to Fig. *b* and using this result, yields

$$\frac{\sin \alpha}{8} = \frac{\sin 105^\circ}{10.47} \quad \alpha = 47.54^\circ$$

Thus, the direction angle ϕ of F_R measured clockwise from the positive x axis is

$$\phi = \alpha - 30^\circ = 47.54^\circ - 30^\circ = 17.5^\circ$$

Ans.

Related to the Retention Capability of a Double Screen Element against Liquid Hydrogen in Earth's Gravity and in Microgravity with Respect to the Applied Stimuli André Pingel,2022-08-04 Metal screens are commonly used as components for fluid handling in spacecraft and rocket tank designs In most cases the screens perform a passive separation of the propellant phases The separation of the liquid from the gaseous propellant phase is a special challenge Liquid gas phase separation means that the gaseous phase is allowed to enter a phase separation device while the liquid phase is blocked The technical application of this process is the depressurization in a propellant tank A certain amount of the gaseous

propellant phase is vented from the tank through the gas port The liquid propellant phase remains in the tank in order to be stored for the engine However if the tank causes a liquid movement during the depressurization a part of the liquid can potentially enter the gas port In order to prevent the unwanted liquid outflow a separation of the liquid from the gas is necessary This is possible with the aid of a double screen element and has already been performed for storable liquids in Earth s gravity and microgravity as well as for cryogenic liquids in Earth s gravity At the current state of the art the separation of the liquid from the gaseous phase of the cryogenic propellant hydrogen using a double screen element has not been performed in microgravity However with regard to a possible application it is mandatory to investigate the function of the double screen element for the real propellant under relevant environmental conditions In this work a cryogenic test facility has been developed and operated successfully under Earth s gravity and microgravity conditions using the drop tower at the University of Bremen Hereby the original cryogenic propellant phases liquid and gaseous hydrogen have been used The experiments show the appearance of the physical processes which are related to the retention capability of a double screen element against liquid hydrogen Furthermore these physical processes can obviously be influenced by an unknown boundary condition at the screens the screen saturation This unknown boundary condition in turn can obviously be influenced by a certain stimulus which causes a special fluid mechanical process A simplified mathematical and two numerical models have been developed which combine the observed physical processes in the experiments Two fitting parameters are introduced which influence the flow through screen pressure loss of the liquid and the gaseous hydrogen phase After the fitting to experimental data the two fitting parameters have been interpreted with respect to a possible screen saturation The results lead to a prediction of the unknown boundary condition and indicate that a partial saturation of the screens with liquid could be present in each considered experiment This can possibly lead to a major influence of the overall resistance of the double screen element against liquid hydrogen

[Dynamics and Kinetics in Structural Biology](#) Keith Moffat,Eaton E. Lattman,2023-10-19 Dynamics and Kinetics in Structural Biology Understand the latest experimental tools in structural biology with this pioneering work Structural biology seeks to understand the chemical mechanisms and functions of biological molecules such as proteins based on their atomic structures Until recently these structures have been studied only statically using procedures which deliberately freeze atomic motion However freezing eliminates the rapid structural motions so essential to biological activity and function the molecules are inactive But with the recent development of X ray free electron laser XFEL sources efforts to conduct dynamic experiments

have expanded using the principles of dynamics and kinetics to capture active biological molecules as they function Dynamics and Kinetics in Structural Biology promotes the development of these experiments and their successful application It grounds readers in the foundational principles of dynamics and kinetics proceeds through extended discussions of experimental procedures and data analysis techniques and explores experimental frontiers in structural dynamics The book will aid researchers to gather and interpret cutting edge data on the dynamic structure of biological molecules under conditions where they retain their biological functions Dynamics and Kinetics in Structural Biology offers readers Authorship by founding figures in the field In depth presentation of time resolved X ray crystallography solution scattering and more A pioneering contribution to a rapidly developing field of study Dynamics and Kinetics in Structural Biology is essential reading for graduate students scientists researchers and industry professionals engaged in structural studies of biological systems Industry professionals considering dynamic studies in the development of new product lines will also benefit
