An Algebraic Introduction to Complex Projective Geometry Christian Peskine, 1843 In this introduction to commutative algebra the author choses a route that leads the reader through the essential ideas without getting embroiled in technicalities He takes the reader quickly to the fundamentals of complex projective geometry requiring only a basic knowledge of linear and multilinear algebra and some elementary group theory The author divides the book into three parts In the first he develops the general theory of noetherian rings and modules He includes a certain amount of homological algebra and he emphasizes rings and modules of fractions as preparation for working with sheaves In the second part he discusses polynomial rings in several variables with coefficients in the field of complex numbers After Noether s normalization lemma and Hilbert s Nullstellensatz the author introduces affine complex schemes and their morphisms he then proves Zariski s main theorem and Chevalley s semi continuity theorem Finally the author s detailed study of Weil and Cartier divisors provides a solid background for modern intersection theory This is an excellent textbook for those who seek an efficient and rapid introduction to the geometric applications of commutative algebra
