

Overview

The K107 drive motor control module, often referred to as the drive motor generator power inverter module, converts high voltage direct current (DC) electrical energy to 3 phase alternating current (AC) electrical energy. The K107 drive motor control module operates the H160 drive motor based upon hybrid/EV powertrain control module commands. The K107 drive motor control module is cooled with pre-mixed Dexcool® circulating directly through the module as one part of the Power Electronics Coolant Loop.

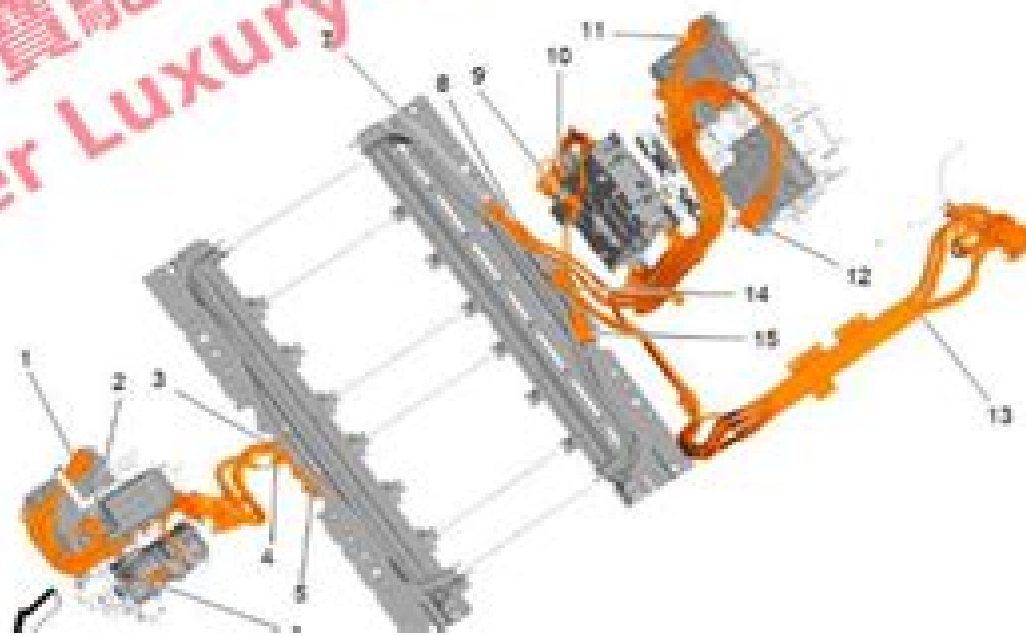

The vehicle may contain more than one drive motor control module based upon option content. The K107A drive motor control module is located on the top of front transmission. K107B drive motor control module 2 is located on the top of right side rear transmission (right side is a dual motor option), and K107C drive motor control module 3 is located on the top of the left side rear transmission.

High Voltage Circuits

Direct Current (DC)

The K107 drive motor control module is connected to the positive and negative terminals of the high voltage DC hybrid/EV battery pack. Both of the negative and positive high voltage DC battery poles are isolated from the vehicle chassis by a specific amount of resistance. Each high voltage DC bus is switched ON or OFF by a high voltage high current contactor relay contained within the hybrid/EV battery pack. All high voltage DC negative and positive DC cables are individually shielded, and orange in color to alert the technician to the potential presence of high voltage.

The A4 Hybrid/EV Battery Pack supplies high voltage through the use of DC cables connected to the components listed below.
