Biological Regulation and Development Robert Goldberger,1979-03-01 The motivation for us to produce a treatise on regulation was mainly our conviction that it would be fun and at the same time productive to approach the subject in a way that differs from that of other treatises We had ourselves written reviews for various volumes over the years most of them bringing together all possible facts relevant to a particular operon virus or biosynthetic system And we were not convinced of the value of such reviews for anyone but the expert in the field reviewed We thought it might be more interesting and more instructive for both author and reader to avoid reviewing topics that anyone scientist might work on but instead to review the various parts of what many different scientists work on Cutting across the traditional boundaries that have separated the subjects in past volumes on regulation is not an easy thing to do not because it is difficult to think of what interesting topics should replace the old ones but because it is difficult to find authors who possess sufficient breadth of knowledge and who are willing to write about areas outside those pursued in their own laboratories For example no one scientist works on suppression per se He may study the structure of suppressor tRNAs in Escherichia coli he may study phenotypic suppression of various characters in drosophila he may study polarity in gene expression and so on California.
