

The average pH of the human stomach during digestion is approximately 2.5, while the average pH of the small intestine during digestion is about 8.

The graph below shows how pH affects the enzyme activity of four different enzymes: A, B, C, and D.

6. What will most likely happen to the action of an enzyme from the small intestine if it is placed in an environment similar to the environment in which enzyme C functions best?
 - a. It would no longer be able to function because the environment is too acidic.
 - b. It would adapt to the new environment and start carrying out the same function as enzyme C.
 - c. It would continue to function because it is able to modify the pH of the environment.
 - d. It would be able to function because the pH of the environment is similar to that of the intestine.
7. Lysosomes break open during the process of digestion, releasing enzymes into the cytoplasm. Which statement may explain why the entire cell may not be digested?
 - a. The acidic environment of the cytoplasm destroys the enzymes.
 - b. Antibodies in the cytoplasm break down foreign enzymes.
 - c. The pH of the cytoplasm causes the enzymes to function less effectively.
 - d. Enzymes can function only in the location where they are synthesized.
8. Which enzyme functions best in a pH environment most similar to that of human stomach enzymes?
 - a. A
 - b. C
 - c. B
 - d. D
