Introduction to Engineering Fluid Mechanics Marcel Escudier, 2017-10-27 We inhabit a world of fluids including air a gas water a liquid steam vapour and the numerous natural and synthetic fluids which are essential to modern day life Fluid mechanics concerns the way fluids flow in response to imposed stresses The subject plays a central role in the education of students of mechanical engineering as well as chemical engineers aeronautical and aerospace engineers and civil engineers This textbook includes numerous examples of practical applications of the theoretical ideas presented such as calculating the thrust of a jet engine the shock and expansion wave patterns for supersonic flow over a diamond shaped aerofoil the forces created by liquid flow through a pipe bend and or junction and the power output of a gas turbine The first ten chapters of the book are suitable for first year undergraduates The latter half covers material suitable for fluid mechanics courses for upper level students Although knowledge of calculus is essential this text focuses on the underlying physics The book emphasizes the role of dimensions and dimensional analysis and includes more material on the flow of non Newtonian liquids than is usual in a general book on fluid mechanics a reminder that the majority of synthetic liquids are non Newtonian in character

Fluid Mechanics Pijush K. Kundu, Ira M. Experimental and Theoretical Investigations of the Physical Processes Related to the Retention Capability of a Double Screen Element against Liquid Hydrogen in Earth's Gravity and in Microgravity with Respect to the Applied Stimuli André Pingel, 2022-08-04 Metal screens are commonly used as components for fluid handling in spacecraft and rocket tank designs In most cases the screens perform a passive separation of the propellant phases The separation of the liquid from the gaseous propellant phase is a special challenge Liquid gas phase separation means that the gaseous phase is allowed to enter a phase separation device while the liquid phase is blocked The technical application of this process is the depressurization in a propellant tank A certain amount of the gaseous propellant phase is vented from the tank through the gas port The liquid propellant phase remains in the tank in order to be stored for the engine However if the tank causes a liquid movement during the depressurization a part of the liquid can potentially enter the gas port In order to prevent the unwanted liquid outflow a separation of the liquid from the gas is necessary This is possible with the aid of a double screen element and has already been performed for storable liquids in Earth's gravity and microgravity as well as for cryogenic liquids in Earth's gravity At the current state of the art the separation of the liquid from the gaseous phase of the cryogenic propellant hydrogen using a double screen element has not been performed in microgravity However with regard to a possible application it is mandatory to investigate the function of the double screen element for the real propellant under relevant environmental conditions In this work a cryogenic test facility has been developed and operated successfully under Earth's gravity and microgravity conditions using the drop tower at the University of Bremen Hereby the original cryogenic propellant phases liquid and gaseous hydrogen have been used The experiments show the appearance of the physical processes which are related to the retention capability of a double screen element against liquid hydrogen Furthermore these physical processes can obviously be influenced by an unknown boundary condition at the screens the screen saturation This unknown boundary condition in turn can obviously be influenced by a certain stimulus which causes a special fluid mechanical process A simplified mathematical and two numerical models have been developed which combine the observed physical processes in the experiments Two fitting parameters are introduced which influence the flow through screen

pressure loss of the liquid and the gaseous hydrogen phase After the fitting to experimental data the two fitting parameters have been interpreted with respect to a possible screen saturation The results lead to a prediction of the unknown boundary condition and indicate that a partial saturation of the screens with liquid could be present in each considered experiment This can possibly lead to a major influence of the overall resistance of the double screen element against liquid hydrogen
