My Notes

## Lesson 20-1 Pythagorean Theorem

- The corresponding sides of similar triangles are proportional, so you can write proportions involving sides of the triangles from Item 2. Complete each proportion. Then find the cross products.

$$\frac{b}{a} = \frac{\boxed{\phantom{000}}}{b}$$

$$\frac{a}{\boxed{\phantom{000}}} = \frac{c}{a}$$

- Use the equations from Item 3 and algebra to prove  $a^2 + b^2 = c^2$ .

$$\begin{aligned} 3^2 + 4^2 & \stackrel{?}{=} 6^2 \\ 9 + 16 & \stackrel{?}{=} 36 \\ 25 & \neq 36 \end{aligned}$$

### Check Your Understanding

- Pythagorean triple** is a set of three nonzero whole numbers that satisfy the Pythagorean Theorem. Explain why the numbers 3, 4, and 6 do not form a Pythagorean triple.
- Explain why the Pythagorean Theorem relationship,  $a^2 + b^2 = c^2$ , is only true if  $c$  is greater than both  $a$  and  $b$ .

*It's about Time* Roger Cooke, 2017-02-28 This book has three main goals First it explores a selection of topics from the early period of the theory of relativity focusing on particular aspects that are interesting or unusual These include the twin paradox relativistic mechanics and its interaction with Maxwell's laws the earliest triumphs of general relativity relating to the orbit of Mercury and the deflection of light passing near the sun and the surprising bizarre metric of Kurt Godel in which time travel is possible Second it provides an exposition of the differential geometry needed to understand these topics on a level that is intended to be accessible to those with just two years of university level mathematics as background Third it reflects on the historical development of the subject and its significance for our understanding of what reality is and how we can know about the physical universe The book also takes note of historical prefigurations of relativity such as Euler's 1744 result that a particle moving on a surface and subject to no tangential acceleration will move along a geodesic and the work of Lorentz and Poincare on space time coordinate transformations between two observers in motion at constant relative velocity The book is aimed at advanced undergraduate mathematics science and engineering majors and of course at any interested person who knows a little university level mathematics The reader is assumed to know the rudiments of advanced calculus a few techniques for solving differential equations some linear algebra and basics of set theory and groups

**Film & Video Finder**, 1997 Euler Through Time V. S. Varadarajan, 2006 Euler is one of the greatest and most prolific mathematicians of all time He wrote the first accessible books on calculus created the theory of circular functions and discovered new areas of research such as elliptic integrals the calculus of variations graph theory divergent series and so on It took hundreds of years for his successors to develop in full the theories he began and some of his themes are still at the center of today's mathematics It is of great interest therefore to examine his work and its relation to current mathematics This book attempts to do that In number theory the discoveries he made empirically would require for their eventual understanding such sophisticated developments as the reciprocity laws and class field theory His pioneering work on elliptic integrals is the precursor of the modern theory of abelian functions and abelian integrals His evaluation of zeta and multizeta values is not only a fantastic and exciting story but very relevant to us because they are at the confluence of much research in algebraic geometry and number theory today Chapters 2 and 3 of the book Anticipating his successors by more than a century Euler created a theory of summation of series that do not converge in the traditional manner Chapter 5 of the book treats the progression of ideas regarding divergent series from Euler to many parts of modern analysis and quantum physics The last chapter contains a brief treatment of Euler products Euler discovered the product formula over the primes for the zeta function as well as for a small number of what are now called Dirichlet L

functions Here the book goes into the development of the theory of such Euler products and the role they play in number theory thus offering the reader a glimpse of current developments the Langlands program

Teaching Mathematics in Grades 6 - 12 Randall E. Groth,2012-08-10 A journey into the vibrant and intriguing world of mathematics education Teaching Mathematics in Grades 6 12 explores how research in mathematics education can inform teaching practice in grades 6 12 The author shows secondary mathematics teachers the value of being a researcher in the classroom by constantly experimenting with methods for developing students mathematical thinking and then connecting this research to practices that enhance students understanding of the material The chapters in Part I introduce secondary teachers to the

field of mathematics education with cross cutting issues that apply to teaching and learning in all mathematics content areas The chapters in Part II are devoted to specific mathematics content strands and describe how students think about mathematical concepts The goal of the text is to have secondary math teachers gain a deeper understanding of the types of mathematical knowledge their students bring to grade 6 12 classrooms and how students thinking may develop in response to different teaching strategies
