Purpose: to dissect squid in order to develop a better understanding of their anatomy.

Background: Maybe you think that snails, clams, mussels, scallops, and octopods are very different. Yet, they are all in the same category of animals known as mollusks. They are generally similar. Mollusks are some of the most well known of invertebrate soft creatures (there are over 20,000 species). Some are very rare and are only found in very deep-water.

Mollusks have three body regions:

1. The head contains the "brain" and the sensory organs.
2. The "visceral mass" contains the internal organs.
3. The "foot" is the muscular part of the body.

Mollusks usually have a shell which is secreted by a body wall called the mantle. Many mollusks have a tongue of sorts, called a radula. It is like the sandpaper. Mollusks have well developed body organs that are used in feeding, sensory, circulatory, and nervous systems.

The class cephalopoda, meaning "head-footed," includes squids, octopods, cuttlefish and nautilus. The feet (arms) of these creatures are connected to their heads, not their bodies. The rest of the body is in front of the head. That's why they are called, "head-footed."

The cephalopods appear to be very different from other mollusks, but physiologically they are similar. Cephalopods, like most mollusks, have a mantle, a mantle cavity, a radula, and a U-shaped digestive tract. Cephalopods have two kidneys and three hearts, which pump blue blood. They are carnivores that feed on fish, shrimp, crabs and other cephalopods.

The most obvious difference between most cephalopods and other mollusks is the apparent lack of a shell. Octopuses do not have shells at all, while squids have a small internal shell. (Nautilus, which are found in the South Pacific and Indian oceans, are the only cephalopods with an external shell. They are also the only cephalopods with four gills instead of two.)
