

7.11 Finding the Focus and Directrix of a Parabola Spring 2017 Notes

The goal of today's lesson is to be able to find the focus and directrix of a parabola given the equation of the parabola.

Basic geometric properties of a parabola:

- The *axis of symmetry* passes through the focus and directrix, and it is *perpendicular* to the directrix.
- The *focus* is always *inside* the curve of the parabola.
- The *directrix* never intersects the parabola itself.
- The vertex is equidistant from the focus and directrix.
- Variable p is a *directed distance* from the vertex to the focus (or directrix to vertex). By a *directed distance*, we mean that the $\pm$ sign on variable p tells us how the parabola is oriented: if p is positive, the parabola opens upward or to the right; if p is negative, the parabola opens downward or to the left.

Label all of the terms on the figure below:

Let's define p as the *directed distance* from the vertex to the focus. Let's determine the equation of a parabola with its vertex at the origin $(0, 0)$ and its focus at $(0, p)$.

Let's write the equation for this parabola, using the geometric definition.
