Key benefits

The Thermo Scientific™ iCAP™ 7000 Series ICP-OES provides the lowest cost of analysis through productivity, sensitivity and ease of use.

- The echelle polychromator enables rapid, simultaneous, multi-element analysis.
- The compact spectrometer allows an efficient optical gas purge, enabling low running costs.
- A low number of optical surfaces provides powerful light transmission for high sensitivity and optimized signal to noise ratios enabling low detection limits.
- Outstanding optical resolution combined with easy method development reduces spectral overlap and the need for mathematical interference corrections.
- Wavelength coverage of 167.4–847 nm enables access to the most comprehensive range of useful analytical lines.
- Innovative thermostatic control ensures that the instrument remains extremely stable, providing long term precision.

Introduction

Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES) is an elemental analysis technique that derives its analytical data from the emission spectra of elements excited within a high-temperature plasma. The purpose of the ICP-OES optical system is to separate element-specific wavelengths of light, emitted from the excited sample and to focus the resolved light onto the detector as efficiently as possible. The spectrometer is comprised of two sections, the fore-optics and the polychromator. When the light exits the polychromator, it is focused on to the detector.

Plasma viewing configurations

ICP-OES instruments can be configured as radial, axial or dual view. In the radial configuration, the plasma is viewed from the side, while in the axial configuration, the plasma is viewed end-on (along the length of the plasma) and in the dual view configuration, the plasma can be viewed in either the radial or axial orientation (see Figure 1).
