Theory Test In Kinetic:

Brownian Motion and Molecular Reality George E. Smith, Raghav Seth, 2020-08-14 Between 1905 and 1913 French physicist Jean Perrin's experiments on Brownian motion ostensibly put a definitive end to the long debate regarding the real existence of molecules proving the atomic theory of matter. While Perrin's results had a significant impact at the time, later examination of his experiments questioned whether he really gained experimental access to the molecular realm. The experiments were successful in determining the mean kinetic energy of the granules of Brownian motion; however, the values for molecular magnitudes Perrin inferred from them simply presupposed that the granule mean kinetic energy was the same as the mean molecular kinetic energy in the fluid in which the granules move. This stipulation became increasingly questionable in the years between 1908 and 1913 as significantly lower values for these magnitudes were obtained from other experimental results like alpha particle emissions ionization and Planck's blackbody radiation equation. In this case study in the history and philosophy of science, George E. Smith and Raghav Seth here argue that despite doubts, Perrin's measurements were nevertheless exemplars of theory-mediated measurement: the practice of obtaining values for an inaccessible quantity by inferring them from an accessible proxy via theoretical relationships between them. They argue that it was actually Perrin, more than any of his contemporaries who championed this approach during the years in question. The practice of theory-mediated measurement in physics had a long history before 1900, but the concerted efforts of Perrin, Rutherford, Millikan, Planck, and their colleagues led to the central role this form of evidence has had in microphysical research ever since. Seth and Smith's study thus replaces an untenable legend with an account that is not only tenable but more instructive about what the evidence did and did not show.

Particles and Waves Peter Achinstein, 1991-04-18 This volume brings together eleven essays by the distinguished philosopher of science Peter Achinstein The unifying theme is the nature of the philosophical problems surrounding the postulation of unobservable entities such as light waves molecules and electrons How if at all is it possible to confirm scientific hypotheses about unobservables Achinstein examines this question as it arose in actual scientific practice in three nineteenth century episodes the debate between particle and wave theorists of light Maxwell's kinetic theory of gases and J J Thomson's discovery of the electron The book contains three parts each devoted to one of these topics beginning with an essay presenting the historical background of the episode and an introduction to the philosophical issues There is an illuminating evaluation of various scientific methodologies including hypothetico deductivism inductivism and the method of independent warrant which combines features of the first two Achinstein assesses the philosophical validity of both nineteenth century and modern answers to questions about unobservables and presents and defends his own solutions
