Sustainable Composites for Automotive Engineering Vijay Raghunathan, Sanjay Mavinkere Rangappa, Vinod Ayyappan, Suchart Siengchin, 2025-09-01 Sustainable Composites for Automotive Engineering presents recent trends in this important research field. Emphasis is placed on the development, characterization, and application of lightweight composites in various automobile components. The types of materials covered include polymer composites, metal matrix, and ceramic matrix composites. The book takes a 360-degree approach and covers all aspects of the product development cycle, including materials selection as well as design and development processes, testing, characterization, modelling, and simulation and applications. The book will be a valuable reference resource for academic and industrial researchers, materials scientists, and engineers, industrial R D automotive engineers, and manufacturers working in the design and development of composite materials for applications in automobile components. Provides in-depth knowledge about the materials, their properties, and performance and applications in automobile components. Covers polymer matrix composites, ceramic matrix, and metal-based composites. Discusses traditional manufacturing methods and recent developments in sustainable green manufacturing and testing of automobile parts with various industrial case studies. Includes brake friction materials as well as natural and rubber-based composites. Covers OEM regulations, environmental aspects, economic analysis, and life cycle assessment of composite-based products. Non-destructive Testing of Materials in Civil Engineering Krzysztof Schabowicz, 2019-11-19 This book was proposed and organized as a means to present recent developments in the field of nondestructive testing of materials in civil engineering. For this reason, the articles highlighted in this editorial relate to different aspects of nondestructive testing of different materials in civil engineering, from building materials to building structures. The current trend in the development of nondestructive testing of materials in civil engineering is mainly concerned with the detection of flaws and defects in concrete elements and structures, and acoustic methods predominate in this field. As in medicine, the trend is towards designing test equipment that allows one to obtain a picture of the inside of the tested element and materials. From this point of view, interesting results with significance for building practices have been obtained.
