software package is used Setting up of computer simulations and obtained results are described in detail and used EQ3 6 input files are given to guide the reader step by step from the beginning to the end of these exercises Finally some examples of reaction path and reaction transport modeling taken from the available literature are presented The results of these simulations are of fundamental importance to evaluate the amounts of potentially sequestered CO<sub>2</sub> and their evolution with time as well as the time changes of all the other relevant geochemical parameters e g amounts of solid reactants and products composition of the aqueous phase pH redox potential effects on aquifer porosity In other words in this way we are able to predict what occurs when CO<sub>2</sub> is injected into a deep aquifer Provides applications for investigating and predicting geological carbon dioxide sequestration Reviews the geochemical literature in the field Discusses the importance of geochemists in the multidisciplinary study of geological carbon dioxide sequestration
