

Chameleons

Name: _____

There are about 90 different species of chameleons, which are reptiles. Some chameleons are fairly small, at about four inches long including their tails. The largest species, found in East Africa, however, can grow up to two feet long. These lizards live in a variety of habitats, from rain forests and lowlands, to deserts, scrub savannas, and even on mountains. Many chameleons live in trees, but some live in small bushes, in the grass, under fallen leaves, or on top of dry branches. Chameleons can be found in Africa, Madagascar, India, Sri Lanka, and Spain.

One of the most interesting things about chameleons is that they are able to change their skin color quickly. Most people think their skin color changes to match their surroundings and to hide from predators, but this isn't true. The amount of light the chameleon is in, the temperature, and the chameleon's feelings of nervousness or fear, will cause the chameleon's skin color to change. For example, if a chameleon is afraid or angry, it will turn bright green and if it is hungry, it may be brown or yellowish-gray. Usually though, the chameleon's rough skin is a dull brownish-green.

The chameleon's body has several features that make it different than most lizards. For example, while many lizards have five toes on each foot, their toes are not grouped together. On each of the chameleon's feet however, the toes are grouped with two together and then three together. This lets the chameleon hold on to branches easily. Another example is its tail. The chameleon's tail is almost like another leg, as it can wrap around tree branches and hold on when it is climbing. Even though many lizards can regrow their tail if it is broken off, a chameleon doesn't have that ability. Also, another difference can be found with the chameleon's eyes compared to most reptiles. The chameleon's eyes can move in different directions at the same time! This gives it a 360-degree view around its body, and helps it find food.

What do chameleons eat? Chameleons like to eat insects like locusts, crickets, grasshoppers, stick insects, and the praying mantis. Larger chameleons may also eat small animals like birds and other lizards. A few species have been known to eat plants as well. Since chameleons don't move very fast, they use their incredibly long tongue to catch the insects they eat. Their tongue is so long, it is almost as long as their whole body! In fact, chameleons have to keep it bunched up inside their mouths until they see a prey they want to stalk. Once they see their prey, chameleons are able to quickly dart out their suction cup-like tongues and capture their prey.
