Hence it is essential to find and disseminate the key solutions for water quality and scarcity issues. The inaccessibility and poor water quality continue to pose a major threat to human health worldwide. Around billions of people lacking to access drinkable water. The water contains the pathogenic impurities which are responsible for water borne diseases. The concept of water quality mainly depends on the chemical, physical, biological and radiological measurement standards to evaluate the water quality and determine the concentration of all components, then compare the results of this concentration with the purpose for which this water is used. Therefore awareness and a firm grounding in water science are the primary needs of readers, professionals and researchers working in this research area. This book explores the basic concepts and applications of water science. It provides an in depth look at water pollutants, classification, water recycling, qualitative and quantitative analysis and efficient wastewater treatment methodologies. It also provides occurrence, human health risk assessment strategies for removal of radionuclides and pharmaceuticals in aquatic systems. The book chapters are written by leading researchers throughout the world. Franca, Leo M.L. Nollet, 2017-12-14. Given the inherent complexity of food products, most instrumental techniques employed for quality and authenticity evaluation, e.g. chromatographic methods, are time demanding, expensive and involve a considerable amount of manual labor. Therefore, there has been an increasing interest in simpler, faster and reliable analytical methods for assessing food quality attributes. *Spectroscopic Methods in Food Analysis* presents the basic concepts of spectroscopic methods together with a discussion on the most important applications in food analysis. The determination of product quality and authenticity and the detection of adulteration are major issues in the food industry, causing concern among consumers and special attention among food manufacturers. As such, this book explains why spectroscopic methods have been extensively employed to the analysis of food products as they often require minimal or no sample preparation, provide rapid and on line analysis and have the potential to run multiple tests on a single sample, i.e. non destructive. This book consists of concepts related to food quality and

authenticity that are quite broad given the different demands of the manufacturer the consumer the surveillance and the legislative bodies that ultimately provide healthy and safe products
