Small Angle X-Ray and Neutron Scattering from Solutions of Biological Macromolecules Dmitri I. Svergun, Michel H. J. Koch, Peter A. Timmins, Roland P. May, 2013-08-08 Small angle scattering of X rays SAXS and neutrons SANS is an established method for the structural characterization of biological objects in a broad size range from individual macromolecules proteins nucleic acids lipids to large macromolecular complexes SAXS SANS is complementary to the high resolution methods of X ray crystallography and nuclear magnetic resonance allowing for hybrid modeling and also accounting for available biophysical and biochemical data Quantitative characterization of flexible macromolecular systems and mixtures has recently become possible SAXS SANS measurements can be easily performed in different conditions by adding ligands or binding partners and by changing physical and or chemical characteristics of the solvent to provide information on the structural responses The technique provides kinetic information about processes like folding and assembly and also allows one to analyze macromolecular interactions The major factors promoting the increasingly active use of SAXS SANS are modern high brilliance X ray and neutron sources novel data analysis methods and automation of the experiment data processing and interpretation In this book following the presentation of the basics of scattering from isotropic macromolecular solutions modern instrumentation experimental practice and advanced analysis techniques are explained Advantages of X rays rapid data collection small sample volumes and of neutrons contrast variation by hydrogen deuterium exchange are specifically highlighted Examples of applications of the technique to different macromolecular systems are considered with specific emphasis on the synergistic use of SAXS SANS with other structural biophysical and computational techniques

Elasticity and Geometry

Basile Audoly, Yves Pomeau, 2010-06-24 We experience elasticity everywhere in daily life in the straightening or curling of hairs the irreversible deformations of car bodies after a crash or the bouncing of elastic balls in ping pong or soccer The theory of elasticity is essential to the recent developments of applied and fundamental science such as the bio mechanics of DNA filaments and other macro molecules and the animation of virtual characters in computer graphics and materials science In this book the emphasis is on the elasticity of thin bodies plates shells rods in connection with geometry It covers such topics as the mechanics of hairs curled and straight the buckling instabilities of stressed plates including folds and conical points appearing at larger stresses the geometric rigidity of elastic shells and the delamination of thin compressed films It applies general methods of classical analysis including advanced nonlinear aspects bifurcation theory boundary layer analysis to derive detailed fully explicit solutions to specific problems These theoretical concepts are discussed in connection with experiments Mathematical prerequisites are vector analysis and differential equations The book can serve as a concrete introduction to nonlinear methods in analysis
