

K = area of right section
 a = lateral edge
 P_1 = perimeter of right section

Truncated prism is a portion of a prism contained between the base and a plane that is not parallel to the base.

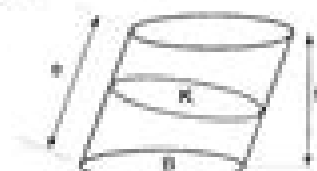

$$V = B \left(\frac{h_1 + h_2 + h_3 + h_4}{4} \right)$$

What is a cylinder?

Cylinder is a solid bounded by a closed cylindrical surface and two parallel planes.

Oblique cylinder is one which has its cylindrical surface not perpendicular to the base.

Volume of cylinder, V

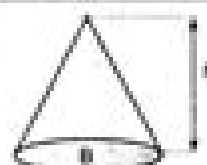

$$V = Bh + Ka$$

where:

B = area of the base
 h = altitude of cylinder
 K = area of right section
 a = lateral edge

What is a pyramid?

Pyramid is a polyhedron of which one face, called the base, is a polygon of any

Volume of cone, V

$$V = \frac{1}{3} Bh$$

where:

B = area of the base
 h = altitude of cone

What is a frustum of a pyramid?

Frustum of a pyramid is a portion of the pyramid included between the base and a section parallel to the base.

Volume of the frustum of cone, V

$$V = \frac{h}{3} (B_1 + B_2 + \sqrt{B_1 B_2})$$

where:

B_1 and B_2 = area of the bases
 h = altitude of the frustum of cone

or

$$V = \frac{\pi h}{3} (R^2 + r^2 + Rr)$$

where:

R = radius of the lower base
 r = radius of the upper base
 h = altitude of the frustum of a cone

What is a prismatoid?

Prismatoid is a polyhedron having for bases two polygons in parallel planes and for lateral faces triangles or trapezoids with one side lying in one base, and the opposite vertex or side lying in the other.

Methods of Solving Solid Geometry Problems Ellina Grigorieva, 2025-09-26 This textbook completes the author's series of books on solving complex math problems and is aimed at developing readers' geometric thinking to master the skills of solving solid geometry problems Written in a friendly manner it discusses many important and sometimes overlooked topics about polyhedra such as their cross sections unfolding inscribed and circumscribed solids and figures of revolution Over 350 unique problems with detailed solutions and hints are presented throughout the text many of which are solved in multiple ways to aid readers with different mathematical backgrounds If the problem is of historical significance or can be related to a similar problem solved in ancient times its original solution historical information about its creation and origin of its methods are also included Various applications of stereometry are also explored including those to chemistry molecular structures and crystallography For example using Euler's formula for a convex polyhedron the reader will learn how to explain the structure

of various chemical compounds such as how to predict the shape of the truncated icosahedron for the C₆₀ fullerene molecule the most powerful antioxidant known today and to prove why the surface of any fullerene C_{2n} consists of $n/2$ regular hexagons and always only 12 regular pentagons Demonstrating the connections between different areas of mathematics Methods of Solving Solid Geometry Problems will be of interest to students who want to excel in math competitions and to those who aspire for greater mastery in linear algebra analytic geometry calculus and more advanced topics It can also be used by teachers to stimulate abstract thinking and bring out the originality of their students
