computer science mathematics statistics and econometrics Multistate Systems Reliability Theory with Applications Bent Natvig, 2010-12-07 Most books in reliability theory are dealing with a description of component and system states as binary functioning or failed. However, many systems are composed of multi-state components with different performance levels and several failure modes. There is a great need in a series of applications to have a more refined description of these states for instance the amount of power generated by an electrical power generation system or the amount of gas that can be delivered through an offshore gas pipeline network. This book provides a descriptive account of various types of multistate system bound for multistate systems probabilistic modeling of monitoring and maintenance of multistate systems with components along with examples of applications. Key Features: Looks at modern multistate reliability theory with applications covering a refined description of components and system states. Presents new research such as Bayesian assessment of system availabilities and measures of component importance. Complements the methodological description with two substantial case studies. Reliability engineers and students involved in the field of reliability applied mathematics and probability theory will benefit from this book. **Subject Guide to Books in Print**, 2001 *Staff Paper in Economics and Statistics* Business Economics Office, 1968 *Economic Dynamics in Discrete Time, second edition* Jianjun Miao, 2020-03-03 A unified and comprehensive introduction to the analytical and numerical tools for solving dynamic economic problems substantially revised for the second edition. This book offers a unified comprehensive and up-to-date treatment of analytical and numerical tools for solving dynamic economic problems. The focus is on introducing recursive methods, an important part of every economist's set of tools, and readers will learn to apply recursive methods to a variety of dynamic economic problems. The book is notable for its combination of theoretical foundations and numerical methods. Each topic is first described in theoretical terms with explicit definitions and rigorous proofs; numerical methods and computer codes to implement these methods follow. Drawing on the latest research, the book covers such cutting-edge topics as asset price bubbles, recursive utility, robust control, policy analysis in dynamic New Keynesian models with the zero lower bound on interest rates, and Bayesian estimation of dynamic stochastic general equilibrium (DSGE) models. This second edition has been substantially updated. Responding to renewed interest in modeling with multiple equilibria, it incorporates new material on this topic throughout. It offers an entirely new chapter on deterministic nonlinear systems and provides new material on such topics as linear planar systems, chaos, bifurcations, indeterminacy, and sunspot solutions; pruning nonlinear solutions; the bandit problem; rational inattention models; bequests; self-fulfilling prophecies; the cyclical behavior of unemployment and vacancies; and the long-run risk model. The exposition of each chapter has been revised and improved, and many new figures, Matlab codes, and exercises have been added. A student solutions manual can be purchased separately. **Computational Econometrics** Charles G. Renfro, 2004 This publication contains a substantial amount of detail about the broad history of the development of econometric software based on the personal recollections of many people. For economists, the computer has increasingly

become the primary applied research tool and it is software that makes the computer work *Climate Science, Solutions and Services for Net Zero, Climate-Resilient Food Systems* Pete Falloon, Aled Jones, Siemen Van Berkum, Stefan Kepinski, Mike Rivington, 2024-05-06 Food systems are both a major contributor to global greenhouse gas emissions and are strongly impacted by climate change and weather extremes Solutions to deliver net zero food systems therefore need to take climate impacts adaptation and resilience into account in order to ensure they are appropriate in a changing climate and do not conflict with adaptation goals In a similar way adaptation options for the food system must consider potential trade offs consequences and synergies with net zero and other objectives such as the Sustainable Development Goals Solutions for net zero climate resilient food systems will therefore require systematic interdisciplinary approaches across academia governments business NGOs and the public
