Steven L. Kramer,Jonathan P. Stewart,2024-11-29 This fully updated second edition provides an introduction to geotechnical earthquake engineering for first year graduate students in geotechnical or earthquake engineering graduate programs with a level of detail that will also be useful for more advanced students as well as researchers and practitioners It begins with an introduction to seismology and earthquake ground motions then presents seismic hazard analysis and performance based earthquake engineering PBEE principles Dynamic soil properties pertinent to earthquake engineering applications are examined both to facilitate understanding of soil response to seismic loads and to describe their practical measurement as part of site characterization These topics are followed by site response and its analysis and soil structure interaction Ground failure in the form of soil liquefaction cyclic softening surface fault rupture and seismically induced landslides are also

addressed and the book closes with a chapter on soil improvement and hazard mitigation The first edition has been widely used around the world by geotechnical engineers as well as many seismologists and structural engineers The main text of this book and the four appendices Cover fundamental concepts in applied seismology geotechnical engineering and structural dynamics Contain numerous references for further reading allowing for detailed exploration of background or more advanced material Present worked example problems that illustrate the application of key concepts emphasized in the text Include chapter summaries that emphasize the most important points Present concepts of performance based earthquake engineering with an emphasis on uncertainty and the types of probabilistic analyses needed to implement PBEE in practice Present a broad interdisciplinary narrative drawing from the fields of seismology geotechnical engineering and structural engineering to facilitate holistic understanding of how geotechnical earthquake engineering is applied in seismic hazard and risk analyses and in seismic design

**Earthquake Geotechnical Engineering Design** Michele

Maugeri, Claudio Soccodato, 2014-02-03 Pseudo static analysis is still the most used method to assess the stability of geotechnical systems that are exposed to earthquake forces However this method does not provide any information about the deformations and permanent displacements induced by seismic activity Moreover it is questionable to use this approach when geotechnical systems are affected by frequent and rare seismic events Incidentally the peak ground acceleration has increased from 0.2 to 0.3 g in the seventies to the current value of 0.6 to 0.8 g Therefore a shift from the pseudo static approach to performance based analysis is needed Over the past five years considerable progress has been made in Earthquake Geotechnical Engineering Design EGED The most recent advances are presented in this book in 6 parts The evaluation of the site amplification is covered in Part I of the book In Part II the evaluation of the soil foundation stability against natural slope failure and liquefaction is treated In the following 3 Parts of the book the EGED for different geotechnical systems is presented as follows the design of levees and dams including natural slopes in Part III the design of foundations and soil structure interaction analysis in Part IV underground structures in Part V Finally in Part VI new topics like the design of reinforced earth retaining walls and landfills are covered
