Digital Communication Edward A. Lee, David G. Messerschmitt, 2012-12-06 This book concerns digital communication. Specifically we treat the transport of bit streams from one geographical location to another over various physical media such as wire pairs, coaxial cable, optical fiber, and radio waves. Further we cover the multiple access and synchronization issues relevant to constructing communication networks that simultaneously transport bit streams from many users. The material in this book is thus directly relevant to the design of a multitude of digital communication systems including, for example, local and metropolitan area data networks, voice and video telephony systems, digital CATV distribution, digital cellular and radio systems, the narrowband and broadband integrated services digital network (ISDN), computer communication systems, voiceband data modems, and satellite communication systems. We extract the common principles underlying these and other applications and present them in a unified framework. This book is intended for designers and would be designers of digital communication systems. To limit the scope to manageable proportions we have had to be selective in the topics covered and in the depth of coverage. In the case of advanced information coding and detection theory, for example, we have not tried to duplicate the in-depth coverage of many advanced textbooks but rather have tried to cover those aspects directly relevant to the design of digital communication systems.

Engineering Education, 1982 *Applications in Electronics Pervading Industry, Environment and Society* Sergio Saponara, Alessandro De Gloria, 2022-04-09 This book provides a thorough overview of cutting edge research on electronics applications relevant to industry, the environment, and society at large. It covers a broad spectrum of application domains from automotive to space and from health to security while devoting special attention to the use of embedded devices and sensors for imaging, communication, and control. The volume is based on the 2021 ApplePies Conference held online in September 2021, which brought together researchers and stakeholders to consider the most significant current trends in the field of applied electronics and to debate visions for the future. Areas addressed by the conference included information communication technology, biotechnology, and biomedical imaging, space, secure, clean, and efficient energy, the environment, and smart green and integrated transport. As electronics technology continues to develop apace, constantly meeting previously unthinkable targets, further attention needs to be directed toward the electronics applications and the development of systems that facilitate human activities. This book, written by industrial and academic professionals, represents a valuable contribution in this endeavor.

Subject Guide to Books in Print, 1996 *Information Hiding* David Aucsmith, 2003-05-20 The mid 1990s saw an exciting convergence of a number of different information protection technologies whose theme was the hiding as opposed to encryption of information Copyright marking schemes are about hiding either copyright notices or individual serial numbers imperceptibly in digital audio and video as a component in intellectual property protection systems anonymous communication is another area of rapid growth with people designing systems for electronic cash digital elections and privacy in mobile communications security researchers are also interested in stray communication channels such as those which arise via shared

resources in operating systems or the physical leakage of information through radio frequency emissions and finally many workers in these fields drew inspiration from classical hidden communication methods such as steganography and spread spectrum radio. The first international workshop on this new emergent discipline of information hiding was organised by Ross Anderson and held at the Isaac Newton Institute Cambridge from the 30th May to the 1st June 1996 and was judged by attendees to be a successful and significant event. In addition to a number of research papers we had invited talks from David Kahn on the history of steganography and from Gus Simmons on the history of subliminal channels. We also had a number of discussion sessions culminating in a series of votes on common terms and definitions. These papers and talks together with minutes of the discussion can be found in the proceedings which are published in this series as Volume 1174. **Scientific and Technical Books and Serials in Print**, 1989 Books in Print Supplement, 2002 *British Books in Print*, 1985
