Perry Ferguson Shannon Johnson Kelly Hanson Kimberly Houses 10/05/2014 Introduction Stem cells are unspecified cells that have the ability through cell division to become specialized cells. These cells possess regenerative properties for longer periods of time than other cells. And, in certain conditions can be induced to become tissue or organ specific cells. By seeking to understand their regenerative process, scientists can treat, prevent and maybe someday cure diseases such as diabetes and heart disease.

This paper will cover what the research is looking at, and the processes that it has progressed through. As with most science discoveries and the technology that is founded with them, there is more to consider than just the science itself. These considerations include economical issues, political and legal issues, social and psychological issues, cultural impacts, moral issues and environmental issues. Stem cell research impacts all of these factions of the human world.

With the potential for so much conflict and misunderstanding a clear and defined consideration of budding points of contention is needed to address these issues in a manner that allows both the progression of the science while still moderating any negative impacts to society. In light of human stems cells potential to treat, prevent and possibly cure disease, scientists and legislators must work in conjunction to optimize this potential for the betterment of all while mitigating the potential negative impact to society.

Brief Description on Technology Technology is knowledge that is used to create tools, develop skills and collect or extract materials. It is also the combination of scientific method and material to meet an objective or to solve a problem. There are several types of stem cell three of which are embryonic stem cells, adult or somatic stem cells, and induced blueprint stem cells. Embryonic stems cells are produced from embryos. A large portion of embryonic stems cells actually come from eggs that have been fertilized in vitro.

However these are not from eggs that are fertilized in women they actually are made in an in vitro fertilization clinic. In vitro fertilization (IVF) is a method used for combining an egg and sperm together in a laboratory. When an embryonic stem cell is created in a laboratory this means that cells are transferred from a preimplantation-stage and then placed into a plastic culture. The culture dish normally has a broth known as culture medium. This process is not one that is always successful meaning that not all embryos will divide and fill the laboratory dish.

The ones that do split are then gently removed and placed into several other dishes. This process is one that takes several months being that every time a culture dish is full the cells are removed and then divided into other culture dishes; each time the

Stem Cell Research Great Britain. Parliament. House of Lords. Select Committee on Stem Cell Research, Great Britain. Parliament. House of Lords, 2002 The Committee was appointed in March 2001 to examine the issues arising from the Human Fertilisation and Embryology Research Purposes Regulations 2001 These regulations extended the legal grounds for research on human embryos to include the increase of knowledge about the development of embryos or serious disease or to enable such knowledge to help in the development of treatments for serious diseases The Committee's report analyses the potential of stem cell research to generate new therapies and assesses the relative scientific advantages and disadvantages of research on embryonic and adult stem cells It considers the ethical concerns about the use of early human embryos for research purposes and the implications of developments in cell nuclear replacement and reproductive cloning The report discusses the current regulatory regime and the scope for future legislation including the issue of informed consent and the creation of stem cell banks Overall the Committee finds that there is a strong scientific and medical case for continued research on human embryonic stem cells in order to realise the full therapeutic potential of stem cell research Adult stem cell research holds the promise of future therapies which might make further research on embryonic cells unnecessary although this is unlikely in the foreseeable future In the meantime to ensure maximum medical benefit it is necessary to keep

both routes to therapy open since neither alone is likely to meet all therapeutic needs The role of the Human Fertilisation and Embryology Authority is crucial to the effective regulation of research and maintenance of public confidence **Federal Funding for Stem Cell Research** United States. Stem Cells Department of Health and Human Services, National Institutes of Health, 2013-10-05 In February 2001 the Secretary of Health and Human Services requested that the National Institutes of Health prepare a summary report on the state of the science on stem cells. This report was developed in response to his request. It provides the current information about the biology of stem cells derived from all sources: embryo, fetal tissue, and adult. Since 1998, when human pluripotent stem cells were first isolated, research on stem cells has received much public attention, both because of its extraordinary promise and because of relevant legal and ethical issues. Underlying this recent public scrutiny is decades of painstaking work by scientists in many fields who have been deciphering some of the most fundamental questions about life, with the goal of improving health. In the last several decades, investments in basic research have yielded extensive knowledge about the many and complex processes involved in the development of an organism, including the control of cellular development. But many questions remain. How does a single cell, the fertilized egg, give rise to a complex, multi-cellular organism? The question represents a fundamental challenge in developmental biology. Researchers are now seeking to understand in greater detail the genetic factors that regulate cell differentiation in early development. Put simply, stem cells are self-renewing, unspecialized cells that can give rise to multiple types of specialized cells of the body. The process by which dividing, unspecialized cells are equipped to perform specific functions, muscle contraction or nerve cell communication, for example, is called differentiation and is fundamental to the development of the mature organism. It is now known that stem cells in various forms can be obtained from the embryo, the fetus, and the adult. The report is a review of the state of the science of stem cell research as of June 17, 2001. Included in this report is subject matter addressing stem cells from adult, fetal tissue, and embryonic sources. Because so much of the progress made to date was dependent on animal models, a significant emphasis is placed on understandings gained from mouse models of development and mouse stem cell research. The report also devotes substantial attention to scientific publications on the characterization of specialized cells developed from embryonic stem cells and the plasticity of adult stem cells. Both scientific and lay publications use a variety of terms to describe stem cells and their properties. For this reason, this report adopts a lexicon of terms and it is used consistently throughout. In several places in the report, discovery timelines are provided. The various sources of stem cells are described, as are the techniques used to isolate and develop them. A comprehensive listing of various stem cell isolation and characterizations is also included. In order to ensure the reader is provided information both about the basic biology of stem cells and their therapeutic potential, the report contains several chapters focused on particular diseases which might benefit

from stem cell research These chapters on the use of hematopoietic stem cells followed by focus features on specific nervous system diseases diabetes heart disease and autoimmune diseases serve merely as examples of the many applications of stem cells that are being pursued Also included are features that review aspects of stem cells as therapeutic delivery tools for gene therapy and importantly the safety considerations for developing stem cell based therapies
