

Geometry: Lines and Angles

Line and Angle terminology

A **line segment** has two end points and a definite length

A **ray** has a beginning, but no end point

A **straight line** has no beginning or end point and no definite length.

Where two lines or rays meet or cross, they form an **angle**.

An **angle** is an amount of rotation. It is measured in **degrees**.

Types of angles

Name of angle	Example	Size of angle
Acute angle I am so cute and small and never go past 90°		Between 0° and 90°
Right angle I am always right and form a perfect 90° angle with another line.		Equal to 90°
Obtuse angle I am a lot more relaxed than the right angle and is OB viously bigger than 90° !		Between 90° and 180°
Straight line I like to walk the straight and narrow line and never go anywhere but 180° .		Equal to 180°
Reflex angle I am very flexible and can bend all way past 180° .		Between 180° and 360°
Revolution/angles around a point I like to be different. Let's start a revolution and dance around a circle!		Equal to 360°

Symmetries of Spacetimes and Riemannian Manifolds Krishan L. Duggal, Ramesh Sharma, 2013-11-22 This book provides an upto date information on metric connection and curvatures symmetries used in geometry and physics More specifically we present the characterizations and classifications of Riemannian and Lorentzian manifolds in particular the spacetimes of general relativity admitting metric i.e Killing holothetic and conformal connection i.e affine conformal and projective and curvature symmetries Our approach in this book has the following outstanding features a It is the first ever attempt of a comprehensive collection of the works of a very large number of researchers on all the above mentioned symmetries b We have aimed at bringing together the researchers interested in differential geometry and the mathematical physics of general relativity by giving an invariant as well as the index form of the main formulas and results c Attempt has been made to support several main mathematical results by citing physical examples as applied to general relativity d Overall the presentation is self contained fairly accessible and in some special cases supported by an extensive list of cited references e The material covered should stimulate future research on symmetries Chapters 1 and 2 contain most of the prerequisites for reading the rest of the book We present the language of semi Euclidean spaces manifolds their tensor calculus geometry of null curves non degenerate and degenerate light like hypersurfaces All this is described in invariant as well as the index form
