[A Virtual Reality Interface Design \(VRID\) Model and Methodology](#) Tanriverdi. Vildan, 2001 Virtual reality VR interfaces need to support a richer variety and more complex types of human computer interactions objects behaviors and communications than those observed in conventional interfaces Therefore design and development of VR interfaces is a challenging process that is currently more of an art than a science There is need for design models and methodologies that can guide designers in a thinking comprehensively about the overall design of the VR interface b decomposing the design task into smaller conceptually distinct and easier tasks and c communicating the structure of the design to software developers In this dissertation we introduce a virtual reality interface design VRID model and an associated VRID methodology to guide design of virtual reality interfaces The VRID model aims to provide guidance to designers as to what they should be doing in the design and why while the VRID methodology provides procedural steps and guidelines as to how the design model can be applied methodically The model uses a multi component object architecture to help designers specify graphical features behaviors interactions and communication mechanisms of interface objects The methodology guides designers in generating design specifications at high and low levels of abstraction and facilitates iterations and refinements between the two levels until a conceptually sound and practically implementable design emerges
