Official Gazette of the United States Patent and Trademark Office ,1995 *Boundary-Scan Test* Harry Bleeker, Peter van den Eijnden, Frans de Jong, 1992-12-31 The ever increasing miniaturization of digital electronic components

is hampering the conventional testing of Printed Circuit Boards PCBs by means of bed of nails fixtures Basically this is caused by the very high scale of integration of ICs through which packages with hundreds of pins at very small pitches of down to a fraction of a millimetre have become available As a consequence the trace distances between the copper tracks on a printed circuit board come down to the same value Not only the required small physical dimensions of the test nails have made conventional testing unfeasible but also the complexity to provide test signals for the many hundreds of test nails has grown out of limits Therefore a new board test methodology had to be invented Following the evolution in the IC test technology Boundary Scan testing has become the new approach to PCB testing By taking precautions in the design of the IC design for testability testing on PCB level can be simplified to a great extent This condition has been essential for the success of the introduction of Boundary Scan Test BST at board level
