Human Body: Skeletal System

Made up of bone and cartilage, the human skeletal system has many important functions, including support, movement, protection of internal organs, blood cell production, and mineral storage.

Skeleton

The adult human body has 206 bones and can be divided into 2 parts—the axial skeleton and the appendicular skeleton.

The **axial skeleton** (highlighted in red) includes bones of the skull, vertebral column, ribs, sternum, sacrum, and coccyx, totaling 80 bones.

The **appendicular skeleton** includes the 126 bones of the shoulders, pelvis, and upper and lower extremities.

Bone Tissue

There are 2 types of bone tissue. **Compact bone** is hard, dense, mineralized tissue that gives bone its strength. It usually surrounds spongy bone tissue. **Spongy bone** is a porous layer of tissue that makes bone lightweight. Its spaces usually contain blood vessels and bone marrow, a soft tissue that produces blood cells.

Cartilage

Cartilage is a flexible connective tissue that forms the embryonic skeleton. Most is ossified into bone during fetal and childhood development. In adults, cartilage is found at movable joints, and in the ear, nose, trachea, and other structures. It also connects the ribs and sternum.

The Anatomy and Biology of the Human Skeleton D. Gentry Steele, Claud A. Bramblett, 1988 This handsome volume is the first photographically illustrated textbook to present for both the student and the working archaeologist the anatomy of the human skeleton and the study of skeletal remains from an anthropological perspective It describes the skeleton as not just a structure but a working system in the living body The opening chapter introduces basics of osteology or the study of bones the specialized and often confusing terminology of the field and methods for dealing scientifically with bone specimens The second chapter covers the biology of living bone its structure growth interaction with the rest of the body and response to disease and injury The remainder of the book is a head to foot structure by structure bone by bone tour of the skeleton More than 400 photographs and drawings and more than 80 tables illustrate and analyze features the text describes In each chapter structures are discussed in detail so that not only can landmarks of bones be identified but their functions can be understood and their anomalies identified as well Each bone s articulating partners are listed and the sequence of ossification of each bone is presented Descriptive sections are followed by analyses of applications how to use specific bones to estimate age stature gender biological affinities and state of health at the time of the individual s death Anthropologists archaeologists and paleontologists as well as physicians medical examiners anatomists and students of these disciplines will find this an invaluable reference and textbook

SKELETAL ANATOMY Scott I. Fairgrieve, Tracy S. Oost, 2001-01-01 The Human Skeletal Anatomy Laboratory Manual and Workbook has been designed to help students who are enrolled in courses dedicated to this topic It is the product of many years of designing and instructing a Human Skeletal Biology course for undergraduate students The key to this manual is flexibility Instructors may utilize as much or as little of the manual as they see fit It is largely based on the regional approach to anatomy However the first section of the manual begins with a survey of the microscopic and macroscopic structure of bone After grounding the student in the basics of bone structure the manual then turns to the gross morphological anatomy of skeletal elements The axial skeleton is dealt with first then the appendicular skeleton The manual is designed to cover material in an incremental fashion Specifically the anatomy of less complicated bones such as the ribs sternum and hyoid are discussed prior to other axial bones in order to acquaint students with how to handle real bone material in the laboratory Each successive laboratory session demands more from the student in both the level of understanding and expectations in assigned laboratory exercises Each laboratory session begins with an introduction in order to familiarize the student with the areas to be studied Subsequently the laboratory session has a stated purpose with clear instructions of expectations and learning objectives Important Terms are clearly indicated in boxes to stress to students that these must be understood This is then followed by a clear laboratory Procedure for the student to follow This usually involves the identification of particular features of assigning specific tasks as identified in the various Exercises Finally as a means of stressing the applicability of what has been learned in the laboratory exercise the student will be requested to generate an evaluation of some aspect of the anatomy such as using a method for determining age at death from assigned specimens The student is then required to interpret this information and produce for the next class or session a Laboratory Research Report Guidelines for these reports are contained within this manual Diagrams photographs have been provided for students to label These diagrams are meant to be a study guide Instructors may wish to add anatomical features or de emphasize certain features accordingly
