genes What do genes do These seemingly simple questions are in fact challenging to answer accurately As a result there are widespread misunderstandings and over simplistic answers which lead to common conceptions widely portrayed in the media such as the existence of a gene for a particular characteristic or disease In reality the DNA we inherit interacts continuously with the environment and functions differently as we age What our parents hand down to us is just the beginning of our life story This comprehensive book analyses and explains the gene concept combining philosophical historical psychological and educational perspectives with current research in genetics and genomics It summarises what we currently know and do not know about genes and the potential impact of genetics on all our lives Making Sense of Genes is an accessible but rigorous introduction to contemporary genetics concepts for non experts undergraduate students teachers and healthcare professionals

concern The injecting of experimental genes into humans and animals has triggered recent debates Soon genetically engineered tomatoes and other transgenic vegetables will be available on the shelves of our local grocers As Lee so wisely and eloquently cautions there may be perils along this pathway as well as miraculous discoveries Do dangers lurk in this new technological approach to nature May we unwittingly be doing irreparable harm to individuals not to mention the biosphere This perceptive author even handedly assesses the controversies surrounding the perils that may await us as molecular science m

**Learning About Your Genes: A Primer For Non-biologists** Errol C Friedberg,2018-09-20 Genes were unknowingly discovered in the 19th century by Gregor Mendel a Czechoslovakian monk It was later established that genes are made of DNA a biological compound found in tiny thread like structures called chromosomes that are located in the nuclei of all cells in our bodies DNA consists of chains of entities called bases of which there are four in nature DNA consists of long chains of bases sometimes referred to as DNA sequences that are joined in any order but the precise order and length of which constitute different genes Many but not all genes carry a code called the genetic code a code that instructs the synthesis manufacture of the many hundreds of proteins that we require to survive and execute the many functions of life The genetic code was deciphered in relatively recent years and is considered one of the most significant discoveries in the history of biology Genes that encode instructions for the synthesis of proteins and those that regulate the manufacture of proteins comprise a mere two percent of our DNA Despite our extensive knowledge of biology and the sub discipline of

molecular biology the study of biology at the molecular level the function if any of the rest of the DNA in our cells is unknown Research about genes and DNA has in recent years spawned an endeavor referred to as the Human Genome Project an international collaboration that has successfully determined stored and rendered publicly available the sequences of almost all the genetic content of the chromosomes of the human organism otherwise known as the human genome DNA sequences that are unique to every person on earth have been discovered DNA fingerprints and are now used for identifying criminals The book relates a specific example of identifying a criminal who murdered two women This is the first and only book that we are aware of that educates non biologists about genes It is written in a style and uses a vocabulary that can be comprehended by the average reader who knows very little if anything about genes [The Language of Life](#) George Wells Beadle, Muriel Beadle, 1966
