

About this manual

This manual is designed as an instructional guide for builders, designers, apprentices, cadets and owner builders. It covers the four traditional house building systems used in Australia — Brick veneer, Timber frame, Cavity brick and Concrete block.

While the 'NCC' and 'Australian Standards' provide the legal building requirements, this manual is intended to explain the why and how to put them into practice. The graphical interpretation and step-by-step descriptions is intended for easy comprehension by the apprentice or cadet.

This manual is intended as a general guide to common on-site building methods. Specific dimensions, specifications and design of structural members must be obtained from individually prepared plans and specifications.

Methods adopted in this manual

Methods and details have been chosen through continued consultation with engineers and advisors in national industry, as well as the Timber, Concrete, Concrete block and Clay Brick Associations. While many variations on a particular detail or method may exist, those represented have been selected for their structural soundness, workmanship qualities and because they are generally approved of by engineers in industry and in accordance with the 'National Construction Code'.

NCC & Australian Standards Codes

This manual highlights only common on-site building situations and is not a building code. While every effort has been made to continue to stay up-to-date with the 'NCC' and 'Australian Standards' these codes are under constant review and change. Should doubt arise regarding a particular situation, reference should be made to the most recent edition or amendment of these codes.

Proof readers

Proof readers are selected from engineers and professionals who are held in high regard by the relevant associations and who possess a sound working knowledge of relevant building legislation.

Manufacturer's specifications

This refers either to specifications on using construction material, precast or on-line, produced by manufacturers. It is important to read these instructions as variations are often dependent upon installation being carried out in accordance with them.

Soil testing, footing & slab design

Future structural problems may result if footings are not designed to suit each particular building site. Variations in soils with one major even between adjoining sites. It is advisable to have designs and subsoil tests for footings and slab floors performed by a competent engineer.

Site inspections

Where site and construction inspections are not a requirement, future structural failure may become the builder's legal responsibility. For this reason, it is good practice to have an engineer or building surveyor carry out inspections of footings, slab and frame or masonry work on cavity brick or concrete block houses, followed by a written certification that the work was constructed according to the approval plans and specifications. These certificates may also enhance the future resale of the house.

Roof framing

This manual includes sections and construction of multifunctional roof trusses and steel flat roofs. For 'how to pitch the conventional cut on-site roof' and for roof tables and levels refer to 'The Roof Building Manual'.

Advice for owner builders

Many houses are built by owner builders, a large number of whom are carpenters, bricklayers and other building tradespeople. However, some owner builders are inexperienced in carpentry. For these people it will be beneficial to engage a carpenter to work alongside or have a building labourer regularly visit the site. The added cost will be more than compensated for through savings in time and materials.

Explanation of design wind speed

The design of timber framing, brick/leach and other structural members is closely related to the design wind speed allocated to the individual site.

The average wind velocity for each locality has been established over a 50 year period and then given the following classifications: 'N' represents Non-cyclonic and 'C' represents Cyclonic. The categories are: 'N1' with a design gust wind speed of 44km/hr (minutes per second), 'N2' = 48km/hr, 'N3' and 'C1' indicated as N3C1 = 54km/hr, N3C2 = 60km/hr, N3C3 = 66km/hr and N3C4 = 72km/hr.

To determine the design wind speed for an individual site engineer or either the local government building dept, a local designer, architect or engineer.

Typical Construction Methods

1

This chapter will deal with typical details and methods commonly adopted for each of the four traditional

building systems outlined below. The drawings below are enlarged on the following pages.

TIMBER FRAME (Page 4)

The timber framed house can be applied to one or more stories. The external surface can be clad with timber or manufactured weatherboards and panelling, or acrylic render can be applied. Structural load bearing is performed by the timber frame.

BRICK VENEER (Page 11)

The brick walls are a facade anchored with brick ties to a timber or steel frame. The frame performs the structural load bearing with supporting the roof, ceiling and wall through. A cavity space is provided between the frame and brick wall. This cavity acts as a moisture barrier.

CAVITY BRICK (cavity brick) (Page 26)

Cavity brick construction is two brick walls standing side by side separated by a cavity. Each together with brick ties that cross the cavity and embedded into the mortar joints. Flues can be either concrete slab or timber.

HOLLOW CONCRETE BLOCK MASONRY (180 single leaf) (Page 36)

Reinforcing and grout is usually applied to specific vertical cores. Bricks and a top perimeter bond beam. Walls can be painted or acrylic rendered on one or both sides or simply covered in render coats. Alternatively, plasterboard linings can be applied to the internal surface.
