

Standard Guide for Preparation of Metallographic Specimens¹

This standard is issued under the fixed designation E 3; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 The primary objective of metallographic examinations is to reveal the constituents and structure of metals and their alloys by means of a light optical or scanning electron microscope. In special cases, the objective of the examination may require the development of less detail than in other cases but, under nearly all conditions, the proper selection and preparation of the specimen is of major importance. Because of the diversity in available equipment and the wide variety of problems encountered, the following text presents for the guidance of the metallographer only those practices which experience has shown are generally satisfactory; it cannot and does not describe the variations in technique required to solve individual specimen preparation problems.

NOTE 1—For a more extensive description of various metallographic techniques, refer to Samuels, L. E., *Metallographic Polishing by Mechanical Methods*, American Society for Metals (ASM) Metals Park, OH, 3rd Ed., 1982; Peters, G., *Metallographic Etching*, ASM, 1978; and Vanderhoff, G., *Metallography: Principles and Practice*, McGraw-Hill, NY, 2nd Ed., 1969.

1.2 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

3. Terminology

3.1 Definitions:

3.1.1 For definitions used in this practice, refer to Terminology E 7.

3.2 Definitions of Terms Specific to This Standard:

3.2.1 *castable mount*—a metallographic mount generally made from a two component castable plastic. One component is the resin and the other hardener. Both components can be liquid or one liquid and a powder. Castable mounts generally do not require heat and pressure to cure.

3.2.2 *compression mount*—a metallographic mount made using plastic that requires both heat and pressure for curing.

3.2.3 *planar grinding*—is the first grinding step in a preparation procedure used to bring all specimens into the same plane of polish. It is unique to semi or fully automatic preparation equipment that utilize specimen holders.

3.2.4 *rigid grinding disc*—a non-fabric support surface, such as a composite of metal/ceramic or metal/polymer charged with an abrasive (usually 6 to 15µm diamond particles), and used as the fine grinding operation in a metallographic preparation procedure.

4. Significance and Use

4.1 Microstructures have a strong influence on the properties and successful application of metals and alloys. Determination and control of microstructure requires the use of metallographic examination.

4.2 Many specifications contain a requirement regarding microstructure; hence, a major use for metallographic examination is inspection to ensure that the requirement is met. Other

Metallography of Steels: Interpretation of Structure and the Effects of Processing Hubertus Colpaert, 2018-08-01

Updated and translated by Andr Luiz V da Costa e Silva

This book is a combination of a metallographic atlas for steels and cast irons and an introductory textbook covering the fundamentals of phase transformations and heat treatment of these materials

Every important stage of processing from casting to cold working is clearly discussed and copiously illustrated with metallographs that show the obtained structures both desired and those achieved when deviations occur

First published in 1951 by Professor Hubertus Colpaert from the Institute for Technological Research IPT of S o Paulo Brazil this book became one of the most important Brazilian references for professionals interested in the processing treatment and application of steels and cast irons

In the Fourth Edition and English translation updated and translated by Professor Andr Luiz V da Costa e Silva the concept of the of the original edition was preserved while the important developments of recent decades both in metallographic characterization and in steel and iron products as well as progress in the understanding of the transformations that made the extraordinary developments of these alloys possible were added

Most metallographs are of actual industrial materials and a large number originate from industry leaders or laboratories at the forefront of steel and iron development

As steel continues to be the most widely used metallic material in the world Metallography of Steels continues to be an essential reference for students metallographers and engineers interested in understanding processing

properties structure relationships of the material The balance between theoretical and applied information makes this book a valuable companion for even experienced steel practitioners *Proceedings of International Conference on Advances in Tribology and Engineering Systems* Himanshu C.
