Radiative and Convective Air Cooling is a versatile reference that was carefully designed to help readers master mathematical calculation prediction and application methods for conductive radiative and convective heat transfer in electronic equipment. Presenting material in a way that is practical and useful to engineers and scientists as well as engineering students, this book provides very detailed text examples and their solutions. This approach helps users at all levels of comprehension to strengthen their grasp of the subject and detect their own calculation errors. The beginning of this book is largely devoted to prediction of airflow and well mixed air temperatures in systems and heat sinks, after which it explores convective heat transfer from heat sinks, circuit boards and components. Applying a systematic presentation of information to enhance understanding and computational practice, this book provides complete mathematical derivations and supplements formulae with design plots. Offers complete exercise solutions, Mathcad™ worksheets and PDF images of Mathcad worksheets, lecture aids, landscape formatted PDF files and text example Mathcad worksheets for professors adopting this book. Addresses topics such as methods for multi surface radiation exchange, conductive heat transfer in electronics and finite element theory with a variational calculus method explained for heat conduction. Presents mathematical descriptions of large thermal network problem formulation. Discusses comprehensive thermal spreading resistance theory and includes steady state and time dependent problems. This reference is useful as a professional resource and also ideal for use in a complete course on the subject of electronics cooling with its suggested course schedule and other helpful advice for instructors. Selected sections may be used as application examples in a traditional heat transfer course or to help professionals improve practical computational applications.

Thermal Computations for Electronics Gordon N. Ellison, 2020-05-13. The first edition of Thermal Computations for Electronics: Conductive, Radiative and Convective Air Cooling was based on the author's lecture notes that he developed over the course of nearly 40 years of thermal design and analysis activity, the last 15 years of which included teaching a university course at the senior undergraduate and graduate levels. The subject material was developed from publications of respected researchers and includes topics and methods original to this author. Numerous students have contributed to both the first and second editions; the latter corrected sections, rewritten e.g. radiation spatial effects, Green's function properties for thermal spreading, 1-D FEA theory and application, and some new material added. The flavor and organization of the first edition have been retained, whereby the reader is guided through the analysis process for systems and then components. Important new material has been added regarding altitude effects on forced and buoyancy driven airflow and heat transfer. The first 20% of the book is devoted to the prediction of airflow and well mixed air temperatures in systems, circuit board channels and heat sinks, followed by convective PCB mounted components, including radiative and conductive heat transfer and the resultant temperatures in electronic equipment. Detailed application examples illustrate a variety of problems. Downloads from the CRC website include Mathcad™ text examples, exercise solutions, adopting professors only, plus PDF lecture aids, professors only, and a tutorial. Chapter 14 using

free FEA software to solve a thermal spreading problem This book is a valuable professional resource for self study and is ideal for use in a course on electronics cooling It is well suited for a first course in heat transfer where applications are as important as theory
