

Squaring and Rooting: Inverses

Warm-Up

Solve each equation for x . Remember: These equations usually have two solutions.

A) $x^2 + 21 = 70$

B) $4x^2 - 12 = 13$

C) $(x - 3)^2 + 4 = 40$

1. Review of Quadratic Functions

A. For the equation $y = x^2$, complete the table. Then plot points to construct the graph.

B. If the domain of the equation is $\{-3, -2, -1, 0, 1, 2, 3\}$, then what would be the range?

C. Is this equation a function? Explain.

$$y = x^2$$

2. Inverse with Coordinates

A. Recall that an inverse can be formed by switching the x - and y -coordinates in a relation. Use this method to make a table and graph for the inverse of $y = x^2$.

B. Is this inverse a function? Explain.

3. Inverse with Algebra

Remember that another way to find an inverse is to switch the x and y variables in an equation, then solve for the "new" y .

A. Use this algebraic method to find the inverse of $y = x^2$.

Equation: $y = x^2$

Inverse: $\underline{\hspace{1cm}} = \underline{\hspace{1cm}}^2$

Solve:

Notation: $f^{-1}(x) =$

B. Use a calculator to help you sketch the graph of this inverse equation in the box below.

Does this graph match your answer from #2? Explain.

The Greatest Horse of All Charles Justice, 2008-11-20 Using the most basic statistics completely explained the author selects the sixteen most likely candidates for the title greatest horse of the twentieth century Fifty colts and fillies listed mainly in a 1999 publication by The Blood Horse Inc were compared using a three part process This process narrowed the top contenders to sixteen The past performance data for these Thoroughbreds were obtained from the Daily Racing Form's 2000 publication Champions Using results identical to those explained in the book the author calculates that the best likely average time for Big Brown to run the upcoming Belmont is 147.54 seconds or 2:27.54 One hundred simulations at 12 furlongs based on Big Brown's current 2008 performance data and the past 36 years of Belmont winning times indicate he has a 72 percent chance of winning the triple crown The identical formulas used in the book on the past performance data for Secretariat Seattle Slew and Affirmed came within fractional seconds of predicting their Belmont Triple Crown wins Of course as most Wall Street pundits will warn past performance is not a guarantee of future performance And now in retrospect Big Brown sadly did not win Had he run as he was capable the predicted time stated above would have beaten the winner Da Tara by 2.09 seconds Charles Justice June 5 and 9 2008 **Algebra and**

Riemann-Hilbert Problems, Their Numerical Solution, and the Computation of Nonlinear Special Functions

Thomas Trogdon, Sheehan Olver, 2015-12-22 Riemann-Hilbert problems are fundamental objects of study within complex analysis. Many problems in differential equations and integrable systems, probability and random matrix theory, and asymptotic analysis can be solved by reformulation as a Riemann-Hilbert problem. This book, the most comprehensive one to date on the applied and computational theory of Riemann-Hilbert problems, includes an introduction to computational complex analysis, an introduction to the applied theory of Riemann-Hilbert problems from an analytical and numerical perspective, and a discussion of applications to integrable systems, differential equations, and special function theory. It also includes six fundamental examples and five more sophisticated examples of the analytical and numerical Riemann-Hilbert method, each of mathematical or physical significance or both.

Time-Varying Systems and Computations Patrick DeWilde, Alle-Jan van der Veen, 2013-03-09

Complex function theory and linear algebra provide much of the basic mathematics needed by engineers engaged in numerical computations, signal processing, or control. The transfer function of a linear time-invariant system is a function of the complex variable s or z , and it is analytic in a large part of the complex plane. Many important properties of the system for which it is a transfer function are related to its analytic properties. On the other hand, engineers often encounter small and large matrices which describe linear maps between physically important quantities. In both cases, similar mathematical and computational problems occur: operators, be they transfer functions or matrices, have to be simplified, approximated, decomposed, and realized. Each field has developed theory and techniques to solve the main common problems encountered. Yet there is a large, mysterious gap between complex function theory and numerical linear algebra. For example, complex function theory has solved the problem to find analytic functions of minimal complexity and minimal supremum norm that approximate given values at strategic points in the complex plane. They serve as approximants for a desired behavior of a system to be designed. No similar approximation theory for matrices existed until recently, except for the case where the matrix is very close to singular.
