D. Pettigrew,K. J. Sanderson,W. R. Levick,1986-12-18 Visual neuroscience is the study of the way in which the brain accomplishes sight and this book presents overviews of a range of topics in this area The chapters are grouped into six sections retina retinogeniculate connections visual development comparative visual physiology visual cortex and integrative aspects and the authors describe both their own contributions to the field and the influence of their teacher P O Bishop on their scientific development [Sheets, Diagrams, and Realism in Peirce](#) Frederik Stjernfelt,2022-09-06 This book investigates a number of central problems in the philosophy of Charles Peirce grouped around the realism of his semiotics the issue of how sign systems are developed and used in the investigation of reality Thus it deals with the precise character of Peirce s realism with Peirce s special notion of propositions as signs which at the same time denote and describe the same object It deals with diagrams as signs which depict more or less abstract states of affairs facilitating reasoning about them with assertions as public claims about the truth of propositions It deals with iconicity in logic the issue of self control in reasoning dependences between phenomena in their realist descriptions A number of chapters deal with applied semiotics with biosemiotic sign use among pre human organisms the multimedia combination of pictorial and linguistic information in human semiotic genres like cartoons posters poetry monuments All in all the book makes a strong case for the actual relevance of Peirce s realist

semiotics Directions ,1981 **Neurobiology of the Inner Retina** Reto Weiler,Neville N. Osborne,2013-06-29 The relatively simple stratified nature of the retina and its specialized use in the visual process has long made it an inviting tissue to study both for its own sake and as a model for the more complex processes of the brain For these dual purposes the retina can be thought of as basically consisting of two functional parts First the outer retina comprised of the photoreceptor cells and attendant pigment epithelium serves to capture the photic energy and convert it into a neurochemical response Second the inner layers of the retina mainly bipolar amacrine and ganglion cells and their attendant Müller cells function more clearly as a typical part of the CNS transmitting the photic signals to the brain Between the 8th and 12th of August 1988 more than seventy scientists from all over the world gathered in Oldenburg Federal Republic of Germany for a meeting The neurobiology of the inner retina which was devoted entirely to the neural mechanism of the inner synaptic layer of the vertebrate retina The meeting comprised twenty three separate lectures and four specially arranged discussion groups In addition a number of posters were displayed and a period was allotted specifically for the discussion of these posters The articles contained in this book will serve as a record of the papers delivered at the Oldenburg Meeting and illustrate the advances made in trying to understand the importance of the diversity of amacrine cell morphology and physiology in retinal function
