Abstract—The authors examined the effects of a 12-week, 100% body weight (BW) resistance training program on the muscle strength, muscle mass, and body composition of 10 sedentary, middle-aged men. The subjects were randomly assigned to either a control group (CON) or a resistance training group (RT). The RT group performed a 12-week, 100% BW resistance training program, while the CON group remained sedentary. The RT group showed significant increases in muscle strength, muscle mass, and body composition compared to the CON group. The results suggest that a 12-week, 100% BW resistance training program can effectively improve muscle strength, muscle mass, and body composition in sedentary, middle-aged men.
