

Whitesides' Group: Writing a Paper**

By George M. Whitesides*

1. What is a Scientific Paper?

A paper is an organized description of hypotheses, data and conclusions, intended to instruct the reader. Papers are a central part of research. If your research does not generate papers, it might just as well not have been done. "Interesting and unpublished" is equivalent to "non-existent".

Realize that your objective in research is to formulate and test hypotheses, to draw conclusions from these tests, and to teach these conclusions to others. Your objective is not to "collect data".

A paper is not just an archival device for storing a completed research program; it is also a structure for planning your research in progress. If you clearly understand the purpose and form of a paper, it can be immensely useful to you in organizing and conducting your research. A good outline for the paper is also a good plan for the research program. You should write and rewrite these plans/outlines throughout the course of the research. At the beginning, you will have mostly plan; at the end, mostly outline. The continuous effort to understand, analyze, summarize, and reformulate hypotheses on paper will be immensely more efficient for you than a process in which you collect data and only start to organize them when their collection is "complete".

2. Outlines

2.1. The Reason for Outlines

I emphasize the central place of an outline in writing papers, preparing seminars, and planning research. I especially believe that for you, and for me, it is most efficient to write papers from outlines. An outline is a written plan of the organization of a paper, including the data on which it rests. You should, in fact, think of an outline as a carefully organized and presented set of data, with attendant objectives, hypotheses, and conclusions, rather than an outline of text.

An outline itself contains little text. If you and I can agree on the details of the outline (that is, on the data and organization), the supporting text can be assembled fairly easily. If we

do not agree on the outline, any text is useless. Much of the time in writing a paper goes into the text; most of the thought goes into the organization of the data and into the analysis. It can be relatively efficient in time to go through several (even many) cycles of an outline before beginning to write text; writing many versions of the full text of a paper is slow.

All writing that I do—papers, reports, proposals (and, of course, slides for seminars)—I do from outlines. I urge you to learn how to use them as well.

2.2. How Should You Construct an Outline?

The classical approach is to start with a blank piece of paper, and write down, in any order, all important ideas that occur to you concerning the paper. Ask yourself the obvious questions: "Why did I do this work?"; "What does it mean?"; "What hypotheses did I mean to test?"; "What ones did I actually test?"; "What were the results? Did the work yield a new method of compound? What?"; "What measurements did I make?"; "What compounds? How were they characterized?"; Sketch possible equations, figures, and schemes. It is essential to try to get the major ideas. If you start the research to test one hypothesis, and decide, when you see what you have, that the data really seem to test some other hypothesis better, don't worry. Write them both down, and pick the best combinations of hypotheses, objectives, and data. Often the objectives of a paper when it is finished are different from those used to justify starting the work. Much of good science is opportunistic and revisionist.

When you have written down what you can, start with another piece of paper and try to organize the jumble of the first one. Sort all of your ideas into three major heaps (1–3).

1. Introduction

Why did I do the work? What were the central motivations and hypotheses?

2. Results and Discussion

What were the results? How were compounds made and characterized? What was measured?

3. Conclusions

What does it all mean? What hypotheses were proved or disproved? What did I learn? Why does it make a difference?

The Craft of Scientific Writing Michael Alley, 2018-03-21 The Craft of Scientific Writing is designed to help scientists and engineers both professionals already active in the disciplines as well as students preparing to enter the professions write about their work clearly and effectively Written for use as a text in courses on scientific writing the book includes many useful suggestions about approaching a wide variety of writing tasks from journal papers to grant proposals and from emails to formal reports as well as a concise guide to style and usage appropriate for scientific writing Also useful for self study the book will be an important reference for all scientists and engineers who need to write about their work With this new and updated fourth edition while most technical writing texts have gotten larger over the years this one has streamlined to provide busy readers with the essence of what distinguishes the style of the best scientific documents With this new edition readers will learn not just how to organize information but how to emphasize the key details of that information Also readers will not just learn how to cast their ideas into precise and clear sentences but how to connect these sentences in an energetic fashion In the section on language the new edition goes into much depth about how to make connections between ideas an important issue that few technical writing texts address

Moreover the new edition integrates the discussion of illustrations with language because those two aspects of style are so intertwined Finally the new edition does a better job of explaining how to make the process of writing more efficient From a review of the first edition A refreshing addition to a genre dominated by English teacher style textbooks Instead of listing rules that constrain writers the book uses examples to lay out the path to successful communication Especially helpful and entertaining is the chapter on the writing process Anyone who has spent more time avoiding a writing task than actually doing it will appreciate Alley's tips Dr Ellen Ochoa Deputy Director of Flight Crew Operations Johnson Space Center

Smoothing a Critical Transition Xiaolong Hu, 2020-04-20 This textbook equips students interested in becoming researchers with the essential nontechnical skills After an introduction to graduate schools it discusses preparing for research reading and organizing literature writing research articles and other documents publishing papers presenting research findings at conferences collaboration with advisors and other researchers patent applications research ethics and how to improve research by learning about the history of science These nontechnical skills are just as important as technical ones in terms of becoming a successful graduate student yet they have seldom been taught systematically in courses Further they can bridge the gap from the classroom to the lab making one of the most critical transition periods from student to researcher smoother and more enjoyable The book features a wealth of real life examples and exercises which readers can easily apply in their own research Intended mainly for graduate and upper undergraduate students just embarking on lab research it can also be used as a textbook or reference guide for courses on research methodology and related topics

Human Subject Research for Engineers Joost C.F. de Winter, Dimitra Dodou, 2017-05-17 This Brief introduces engineers to the main principles in ethics research design statistics and publishing of human subject research In recent years engineering has become strongly connected to disciplines such as biology medicine and psychology Often engineers and engineering students are expected to perform human subject research Typical human subject research topics conducted by engineers include human computer interaction e.g. evaluating the usability of software exoskeletons virtual reality teleoperation modelling of human behaviour and decision making often within the framework of big data research product evaluation biometrics behavioural tracking e.g. of work and travel patterns or mobile phone use transport and planning e.g. an analysis of flows or safety issues etc Thus it can be said that knowledge on how to do human subject research is indispensable for a substantial portion of engineers Engineers are generally well trained in calculus and mechanics but may lack the appropriate knowledge on how to do research with human participants In order to do high quality human subject research in an ethical manner several guidelines have to be followed and pitfalls have to be avoided This book discusses these guidelines and pitfalls The aim is to prepare engineers and engineering students to carry out independent research in a responsible manner
