

A Closer Look at Area of Regular Polygons **NOT**

A **regular polygon** is a polygon in which all sides are congruent and all angles are congruent.

Equilateral triangle
Equilateral triangle

Square

Regular pentagon

Any regular polygon can be decomposed into congruent triangles. The area of the regular polygon can be found by finding the area of one of the triangular regions and multiplying by the number of sides of the polygon. This method can be written as follows in the formula.

$$\text{Area of a regular polygon} = \frac{1}{2}Pn$$

where P represents the perimeter and n represents the number

The **apothem** is a segment that connects the center of a regular polygon perpendicularly to a side of the **regular polygon**. The **apothem** is also the perpendicular distance from the center of the figure to a side. The **apothem** divides a side of the regular polygon. In Figure 1 below, a is the length of the apothem.

The **radius** is a segment that connects from the center of the regular polygon to a vertex of the polygon. The **radius** is also the distance from the center of the polygon to a vertex of the polygon. The **radius** divides an interior angle of the regular polygon. In Figure 1 below, r is the length of the radius.

Triangles of special right triangles, $30^\circ-60^\circ-90^\circ$ and $45^\circ-45^\circ-90^\circ$ and the trigonometric ratios can be used to solve problems involving regular polygons.

solving The book contains more than 750 mostly easy but nontrivial problems in all areas of plane geometry and solutions for most of them as well as additional problems for self study some with hints Each chapter also provides concise reminders of basic notions used in the chapter so the book is almost self contained although a good textbook and competent teacher are always recommended More than 450 figures illustrate the problems and their solutions The book can be used by motivated high school students as well as their teachers and parents After solving the problems in the book the student will have mastered the main notions and methods of plane geometry and hopefully will have had fun in the process In the interest of fostering a greater awareness and appreciation of mathematics and its connections to other disciplines and everyday life MSRI and the AMS are publishing books in the Mathematical Circles Library series as a service to young people their parents and teachers and the mathematics profession What a joy Shen s Geometry in Problems is a gift to the school teaching world Beautifully organized by content topic Shen has collated a vast collection of fresh innovative and highly classroom relevant questions problems and challenges sure to enliven the minds and clever thinking of all those studying Euclidean geometry for the first time This book is a spectacular resource for educators and students alike Users will not only sharpen their mathematical understanding of specific topics but will also sharpen their problem solving wits and come to truly own the mathematics explored Also Math Circle leaders can draw much inspiration for session ideas from the material presented in this book James Tanton Mathematician at Large Mathematical Association of America We learn mathematics best by doing mathematics The author of this book recognizes this principle He invites the reader to participate in learning plane geometry through carefully chosen problems with brief explanations leading to much activity The problems in the book are sometimes deep and subtle almost everyone can do some of them and almost no one can do all The reader comes away with a view of geometry refreshed by experience Mark Saul Director of Competitions Mathematical Association of America
